fresnel is a python library for path tracing publication quality images of soft matter simulations in real time. The fastest render performance is possible on NVIDIA GPUs using their [OptiX](#) ray tracing engine. **fresnel** also supports multi-core CPUs using Intel's [Embree](#) ray tracing kernels. Path tracing enables high quality global illumination and advanced rendering effects. **Fresnel** offers intuitive material parameters (like *roughness*, *specular*, and *metal*) and simple predefined lighting setups (like *cloudy* and *lightbox*).

Here are a few samples of what **fresnel** can do:

CHAPTER 1

Gallery

CHAPTER 2

Research

2.1 Protomer

Protomer on the cover of *nature chemistry* volume 11, issue 3:

- Ribbon geometry: `geometry.Mesh`
 - `material`: `roughness = 1.0, specular = 1.0, metal = 0, spec_trans = 0`
 - Generated with: `ribbon`
- Molecular surface: `geometry.Mesh`
 - `material`: `roughness = 2.0, specular = 0.95, metal = 0, spec_trans = 0.95`
 - Generated with `MSMS`
- Lighting: `light.lightbox` with background light
- Rendered with: `tracer.Path`: `samples = 64, light_samples = 32` on the GPU

Author

Jens Glaser

CHAPTER 3

Features

3.1 Cuboids

Cuboid example script:

- Geometry: `geometry.ConvexPolyhedron`: `outline_width = 0.015`
 - `material`: `roughness = 0.1, specular = 1, metal = 0, spec_trans = 0`
 - `outline_material`: `roughness = 0.1, metal = 1, spec_trans = 0, color = (0.95,0.93,0.88)`
 - position, orientation: output of a HOOMD simulation
- Lighting: `light.lightbox`
- Rendered with: `tracer.Path`: `samples = 256, light_samples = 16`

Source code

```
data = numpy.load('cuboids.npz')

scene = fresnel.Scene(fresnel.Device(mode='cpu'))
scene.lights = fresnel.light.lightbox()
W,H,D = data['width']
poly_info = fresnel.util.convex_polyhedron_from_vertices(
    [[-W,-H,-D], [-W,-H, D], [-W, H,-D], [-W, H, D],
     [ W,-H,-D], [ W,-H, D], [ W, H,-D], [ W, H, D]])

geometry = fresnel.geometry.ConvexPolyhedron(
    scene, poly_info,
    position = data['position'],
    orientation = data['orientation'],
    outline_width = 0.015)
geometry.material = fresnel.material.Material(
    color = fresnel.color.linear([0.1, 0.1, 0.6]),
    roughness = 0.1,
    specular = 1)
geometry.outline_material = fresnel.material.Material(
    color = (0.95,0.93,0.88),
    roughness = 0.1,
    metal = 1.0)

scene.camera = fresnel.camera.fit(scene, view='front')
out = fresnel.pathtrace(scene, samples=64,
                        light_samples=32,
                        w=580, h=580)
```

Author

Joshua A. Anderson

3.2 Spheres

Spheres example script:

- Geometry: `geometry.Sphere`: `radius = 0.5, outline_width = 0.1`
 - `material`: `roughness = 0.8, specular = 0.2, metal = 0, spec_trans = 0`
 - `outline_material`: `solid = 1, color = (0,0,0)`
 - positions: output of a HOOMD simulation

- Lighting: `light.cloudy`
- Rendered with: `tracer.Path: samples = 256, light_samples = 16`

Source code

```
data = numpy.load('spheres.npz')

scene = fresnel.Scene()
scene.lights = fresnel.light.cloudy()

geometry = fresnel.geometry.Sphere(
    scene,
    position = data['position'],
    radius = 0.5,
    outline_width = 0.1)

geometry.material = fresnel.material.Material(
    color = fresnel.color.linear([0.1, 0.8, 0.1]),
    roughness = 0.8,
    specular = 0.2)

out = fresnel.pathtrace(scene, samples=64,
                        light_samples=32,
                        w=580, h=580)
```

Author

Joshua A. Anderson

Fresnel binaries are available in the [glotzerlab-software Docker/Singularity](#) images and in packages on [conda-forge](#). You can also compile **fresnel** from source.

4.1 Anaconda package

Fresnel is available on [conda-forge](#). To install, first download and install [miniconda](#). Then add the `conda-forge` channel and install **fresnel**:

```
$ conda config --add channels conda-forge
$ conda install fresnel
```

jupyter and **matplotlib** are required to execute the [fresnel example notebooks](#), install

```
$ conda install jupyter matplotlib
```

You can update **fresnel** with:

```
$ conda update fresnel
```

Note: The **fresnel** package on `conda-forge` does not include GPU support.

4.2 Docker images

Pull the [glotzerlab-software](#) image to get **fresnel** along with many other tools commonly used in simulation and analysis workflows. See full usage information in the [glotzerlab-software documentation](#).

Singularity:

```
$ singularity pull shub://glotzerlab/software
```

Docker:

```
$ docker pull glotzerlab/software
```

4.3 Compile from source

Download source releases directly from the web: <https://glotzerlab.engin.umich.edu/Downloads/fresnel>

```
$ curl -O https://glotzerlab.engin.umich.edu/Downloads/fresnel/fresnel-v0.8.0.tar.gz
```

Or, clone using git:

```
$ git clone --recursive https://github.com/glotzerlab/fresnel
```

Fresnel uses git submodules. Either clone with the `--recursive` option, or execute `git submodule update --init` to fetch the submodules.

4.3.1 Prerequisites

- C++11 capable compiler
- CMake ≥ 2.8
- Python ≥ 2.7
- For CPU execution (required when `ENABLE_EMBREE=ON`):
 - Intel TBB $\geq 4.3.20150611$
 - Intel Embree $\geq 3.0.0$
- For GPU execution (required when `ENABLE_OPTIX=ON`):
 - OptiX ≥ 4.0
 - CUDA ≥ 7.5
- To enable interactive widgets:
 - pyside2
- To execute tests (optional):
 - pytest
 - pillow

`ENABLE_EMBREE` (*defaults ON*) and `ENABLE_OPTIX` (*defaults OFF*) are orthogonal settings, either or both may be enabled.

4.3.2 Optional dependencies

- pytest
 - Required to execute unit tests.

- pillow
 - Required to display rendered output in Jupyter notebooks automatically.
- sphinx
 - Required to build the user documentation.
- doxygen
 - Required to build developer documentation.

4.3.3 Compile

Configure with **cmake** and compile with **make**. Replace `${PREFIX}` your desired installation location.

```
$ mkdir build
$ cd build
$ cmake ../ -DCMAKE_INSTALL_PREFIX=${PREFIX}/lib/python
$ make install -j10
```

By default, **fresnel** builds the Embree (CPU) backend. Pass `-DENABLE_OPTIX=ON` to **cmake** to enable the GPU accelerated OptiX backend.

Add `${PREFIX}/lib/python` to your `PYTHONPATH` to use **fresnel**.

```
$ export PYTHONPATH=$PYTHONPATH:${PREFIX}/lib/python
```

4.3.4 Run tests

Fresnel has extensive unit tests to verify correct execution.

```
$ export PYTHONPATH=/path/to/build
$ cd /path/to/fresnel
$ cd test
$ pytest
```

4.3.5 Build user documentation

Build the user documentation with **sphinx**:

```
$ cd /path/to/fresnel
$ cd doc
$ make html
$ open build/html/index.html
```

4.3.6 Specify search paths

OptiX, **TBB**, **Embree**, and **Python** may be installed in a variety of locations. To specify locations for libraries, use these methods the *first* time you invoke `cmake` in a clean build directory.

Li-brary	Default search path	CMake Custom search path
OptiX	/opt/optix	-DOptiX_INSTALL_DIR=/path/to/optix
TBB	<i>system</i>	TBB_LINK=/path/to/tbb/lib (env var)
Em-bree	<i>system</i>	-Dembree_DIR=/path/to/embree-3.x.y (the directory containing embree-config.cmake)
Python	\$PATH	-DPYTHON_EXECUTABLE=/path/to/bin/python

4.3.7 Build C++ Documentation

To build the developer documentation, execute `doxygen` in the repository root. It will write HTML output in `devdoc/html/index.html`.

fresnel releases follow semantic versioning.

5.1 v0.8.0 (2019-03-05)

- Documentation improvements
- Add `geometry.Polygon`: Simple and/or rounded polygons in the $z=0$ plane.
- API breaking changes:
 - Remove: `geometry.Prism`

5.2 v0.7.1 (2019-02-05)

- Fix conda-forge build on mac

5.3 v0.7.0 (2019-02-05)

- Add `util.convex_polyhedron_from_vertices`: compute convex polyhedron plane origins and normals given a set of vertices
- Improve documentation
- Add `interact.SceneView`: pyside2 widget for interactively rendering scenes with path tracing
- Add `geometry.Mesh`: Arbitrary triangular mesh geometry, instanced with N positions and orientations
- **fresnel** development is now hosted on github: <https://github.com/glotzerlab/fresnel/>
- Improve `light.lightbox` lighting setup
- API breaking changes:

- `geometry.ConvexPolyhedron` arguments changed. It now accepts polyhedron information as a dictionary.

5.4 v0.6.0 (2018-07-06)

- Implement `tracer.Path` on the GPU.
- Implement `ConvexPolyhedron` geometry on the GPU.
- Improve path tracer performance with Russian roulette termination.
- Compile warning-free.
- Fix sphere intersection test bugs on the GPU.
- `tracer.Path` now correctly starts sampling over when resized.
- Wrap C++ code with pybind 2.2
- Make documentation available on readthedocs: <http://fresnel.readthedocs.io>
- Fresnel is now available on conda-forge: <https://anaconda.org/conda-forge/fresnel>
- embree ≥ 3.0 is now required for CPU support
- Improve documentation

5.5 v0.5.0 (2017-07-27)

- Add new lighting setups
 - `lightbox`
 - `cloudy`
 - `ring`
- Adjust brightness of lights in existing setups
- Remove `clearcoat` material parameter
- Add `spec_trans` material parameter
- Add `Path` tracer to render scenes with indirect lighting, reflections, and transparency (*CPU-only*)
- Add `ConvexPolyhedron` geometry (*CPU-only, beta API, subject to change*)
- Add `fresnel.preview` function to easily generate `Preview` traced renders with one line
- Add `fresnel.pathtrace` function to easily generate `Path` traced renders with one line
- Add anti-aliasing (always on for the `Path` tracer, set `aa_level > 0` to enable for `Preview`)
- API breaking changes:
 - `render` no longer exists. Use `preview` or `pathtrace`.
 - `tracer.Direct` is now `tracer.Preview`.

CPU-only features will be implemented on the GPU in a future release.

5.6 v0.4.0 (2017-04-03)

- Enforce requirement: Embree \geq 2.10.0
- Enforce requirement Pybind =1.8.1
- Enforce requirement TBB \geq 4.3
- Rewrite camera API, add `camera.fit` to fit the scene
- scenes default to an automatic fit camera
- Implement area lights, add default lighting setups
- Scene now supports up to 4 lights, specified in camera space
- Implement Disney's principled BRDF
- `Tracer.histogram` computes a histogram of the rendered image
- `Tracer.enable_highlight_warning` highlights overexposed pixels with a given warning color
- `Device.available_modes` lists the available execution modes
- `Device.available_gpus` lists the available GPUs
- Device can now be limited to n GPUs
- API breaking changes:
 - `camera.Orthographic` is now `camera.orthographic`
 - Device now takes the argument n instead of *limit*
 - Scene no longer has a `light_direction` member

5.7 v0.3.0 (2017-03-09)

- Suppress “cannot import name” messages
- Support Nx3 and Nx4 inputs to `color.linear`

5.8 v0.2.0 (2017-03-03)

- Parallel rendering on the CPU
- Fix PTX file installation
- Fix python 2.7 support
- Unit tests
- Fix bug in sphere rendering on GPU

5.9 v0.1.0 (2017-02-02)

- Prototype API
- Sphere geometry

- Prism geometry
- outline materials
- diffuse materials
- Direct tracer

6.1 fresnel-users mailing list

Subscribe to the [fresnel-users](#) mailing list to receive release announcements, post questions for advice on using the software, and discuss potential new features.

6.2 Issue tracker

File bug reports on [fresnel's issue tracker](#).

6.3 Contribute

fresnel is an open source project. Contributions are accepted via pull request to [fresnel's github repository](#). Please review `CONTRIBUTING.MD` in the repository before starting development. You are encouraged to discuss your proposed contribution with the **fresnel** user and developer community who can help you design your contribution to fit smoothly into the existing ecosystem.

Fresnel is a python library that can ray trace publication quality images in real time. It provides a simple python API to define a **scene** consisting of any number of **geometry** primitives and **render** it to an output image.

To start, import the `fresnel` python module.

```
[1]: import fresnel
```

7.1 Define a scene

A **Scene** defines a coordinate system, the **camera** view, the **light sources**, and contains a number of **geometry** primitives. Create a new **Scene** class instance. Scenes come with a default automatic camera that fits the geometry and a default set of lights.

```
[2]: scene = fresnel.Scene()
```

7.2 Add geometry to the scene

A **Scene** may consist of any number of **geometry** objects. Each **geometry** object consists of N primitives of the same type, and a **material** that describes how the primitives interact with light sources. Create 8 spheres with radius 1.0.

```
[3]: geometry = fresnel.geometry.Sphere(scene, N=8, radius=1.0)
```

Geometry objects have a number of per-primitive attributes. These are exposed with an interface compatible with **numpy** arrays, and can copy data from **numpy** arrays efficiently. Set the positions of the spheres:

```
[4]: geometry.position[:] = [[1, 1, 1],  
                             [1, 1, -1],  
                             [1, -1, 1],  
                             [1, -1, -1],
```

(continues on next page)

(continued from previous page)

```
[-1, 1, 1],  
[-1, 1, -1],  
[-1, -1, 1],  
[-1, -1, -1]]
```

Set the **material** of the geometry object to a rough blue surface:

```
[5]: geometry.material = fresnel.material.Material(color=fresnel.color.linear([0.25, 0.5, 0.  
↪9]),  
                                                roughness=0.8)
```

7.3 Render the scene

preview quickly renders the scene from the view point of the camera.

```
[6]: fresnel.preview(scene)
```

```
[6]:
```

Enable *anti-aliasing* if you plan to use the output of **preview** for production use. The scene will take longer to render, but will have crisp edges.

```
[7]: fresnel.preview(scene, aa_level=3)
```

```
[7]:
```

preview only applies direct lighting. Use **pathtrace** to account for indirect lighting. (anti-aliasing is always enabled when path tracing).

```
[8]: fresnel.pathtrace(scene)
```

```
[8]:
```

The resulting image is noisy. Increase the number of *light samples* to obtain a clean image.

```
[9]: fresnel.pathtrace(scene, light_samples=40)
```

```
[9]:
```

7.4 Save output

preview and *pathtrace* return output buffers that can be used like $H \times W \times 4$ RGBA **numpy** arrays. You can pass this standard format on to other python libraries that work images (e.g. [matplotlib](#)).

```
[10]: out = fresnel.preview(scene, aa_level=3)
      print(out[:].shape)
      print(out[:].dtype)

(370, 600, 4)
uint8
```

Use [Pillow](#) to save the rendered output to a png file with transparency.

```
[11]: import PIL
```

```
[12]: image = PIL.Image.fromarray(out[:], mode='RGBA')
      image.save('output.png')
```

To save a JPEG, create an RGB image. This ignores the alpha channel, so the scene background color will show.

```
[13]: image = PIL.Image.fromarray(out[:, :, 0:3], mode='RGB')
      image.save('output.jpeg')
```

This is what `output.jpeg` looks like (the default background color is black):

```
[16]: import IPython.display  
      IPython.display.Image('output.jpeg')
```

```
[16]:
```

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-examples](#) repository.

Primitive properties

Each **geometry** type specifies a number of per-primitive properties. For example, the **Sphere** geometry has per-primitive *position*, *radius*, and *color*.

```
[1]: import fresnel
scene = fresnel.Scene()
```

8.1 Setting properties when creating the geometry

Any of the properties may be set when the **geometry** is created, or they may be left as default values.

```
[2]: geometry = fresnel.geometry.Sphere(scene,
                                         position = [[1,0,1],
                                                       [1,0,-1],
                                                       [-1,0,1],
                                                       [-1,0,-1]],
                                         radius=1.0,
                                         material = fresnel.material.Material(color=fresnel.
                                         ↪color.linear([0.42,0.267,1]))
                                         # per-primitive color left default
                                         )
```

```
[3]: fresnel.preview(scene, aa_level=3)
```

[3]:

8.2 Changing properties after creation

Access the per-primitive properties as if they were **numpy** arrays. The *radius* property for the **Sphere geometry** sets the radius of each primitive.

```
[4]: geometry.radius[:] = [0.5, 0.6, 0.8, 1.0]
```

```
[5]: fresnel.preview(scene, aa_level=3)
```

[5]:

The *position* property sets the position of each sphere in the scene's coordinate system.

```
[6]: geometry.position[:] = [[1.5, 0, 1],  
                             [1.5, 0, -1],  
                             [-1.5, 0, 1],  
                             [-1.5, 0, -1]]
```

```
[7]: fresnel.preview(scene, aa_level=3)
```

[7]:

The *color* property sets a per primitive color. The geometry **material color** and the **primitive color** are mixed with fraction **primitive_color_mix**. A value of 1.0 selects the primitive color, 0.0 selects the *material* color and values in between mix the colors.

```
[8]: geometry.material.primitive_color_mix = 1.0
      geometry.color[:] = fresnel.color.linear([[1,1,1], [0,0,1], [0,1,0], [1,0,0]])
```

```
[9]: fresnel.preview(scene, aa_level=3)
```

```
[9]:
```

```
[10]: geometry.material.primitive_color_mix = 0.5
```

```
[11]: fresnel.preview(scene, aa_level=3)
```

```
[11]:
```

8.3 Reading primitive properties

Primitive properties may be read as well as written.

```
[12]: geometry.radius[:]
[12]: array([0.5, 0.6, 0.8, 1. ], dtype=float32)
```

```
[13]: geometry.position[:]
[13]: array([[ 1.5,  0. ,  1. ],
           [ 1.5,  0. , -1. ],
           [-1.5,  0. ,  1. ],
           [-1.5,  0. , -1. ]], dtype=float32)
```

```
[14]: geometry.color[:]
[14]: array([[1., 1., 1.],
           [0., 0., 1.],
           [0., 1., 0.],
           [1., 0., 0.]], dtype=float32)
```

8.4 Common errors

Primitive properties may be accessed like **numpy** arrays, but they may not be assigned directly.

```
[15]: geometry.radius = 1.0

-----
AttributeError                                Traceback (most recent call last)
<ipython-input-15-020bd663bace> in <module>()
----> 1 geometry.radius = 1.0

AttributeError: can't set attribute
```

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-examples](#) repository.

Material properties

Each **geometry** has an associated **material**. The **material** is a set of parameters that defines how light interacts with the **geometry**. Here is a test scene to demonstrate these properties.

```
[1]: import fresnel
import math
device = fresnel.Device()
scene = fresnel.Scene(device)
position = []
for k in range(5):
    for i in range(5):
        for j in range(5):
            position.append([2*i, 2*j, 2*k])
geometry = fresnel.geometry.Sphere(scene, position = position, radius=1.0)
```

9.1 Material color

The **color** of a material sets its base color. Default material parameters set a primarily diffuse material with light specular highlights.

```
[2]: geometry.material = fresnel.material.Material(color=fresnel.color.linear([0.9,0.714,0.
↪169]))
```

```
[3]: fresnel.pathtrace(scene, w=300, h=300, light_samples=40)
```

```
[3]:
```

9.2 Solid color materials

Set the **solid** parameter to 1.0 to disable material interaction with light. A **solid** material has no shading applied and always displays as **color**.

```
[4]: geometry.material.solid = 1.0
```

```
[5]: fresnel.preview(scene, w=300, h=300, aa_level=3)
```

```
[5]:
```

9.3 Geometry / primitive color mixing

Set **primitive_color_mix** to any value in the range 0.0 to 1.0 to control the amount that the per-primitive colors mix with the geometry color.

```
[6]: geometry.material.primitive_color_mix = 0.5
      geometry.color[:,2] = fresnel.color.linear([0,0,0])
      geometry.color[1::2] = fresnel.color.linear([1,1,1])
```

```
[7]: fresnel.preview(scene, w=300, h=300, aa_level=3)
```

```
[7]:
```

Typical use cases utilize values of either 0.0 (force a single color defined by the material) or 1.0 (force the per primitive color.)

```
[8]: geometry.material.primitive_color_mix = 1.0

      geometry.color[:,4] = fresnel.color.linear([0.25,0.5,1])
      geometry.color[1::4] = fresnel.color.linear([1,0.714,0.169])
      geometry.color[2::4] = fresnel.color.linear([0.42,0.267,1])
      geometry.color[3::4] = fresnel.color.linear([1,0.874,0.169])
```

```
[9]: fresnel.preview(scene, w=300, h=300, aa_level=3)
```

[9]:

To use a **matplotlib** color map, pass the output of the color map to `fresnel.color.linear` so the output colors appear as intended.

```
[10]: import matplotlib, matplotlib.cm
import numpy
geometry.material.solid = 0.0
mapper = matplotlib.cm.ScalarMappable(norm = matplotlib.colors.Normalize(vmin=0,
↪vmax=1, clip=True),
                                     cmap = matplotlib.cm.get_cmap(name='viridis'))

v = numpy.linspace(0,1,len(position))
geometry.color[:] = fresnel.color.linear(mapper.to_rgba(v))
```

```
[11]: fresnel.pathtrace(scene, w=300, h=300, light_samples=40)
```

[11]:

9.4 All properties

Materials have a number of intuitive properties. All are defined in a nominal range from 0 to 1, though some values can be pushed past 1 for extremely strong effects.

- roughness - Set the roughness of the material. Recommend values ≥ 0.1 .
- specular - Control the strength of the specular highlights
- metal - 0: dielectric materials (plastic, glass, etc...). 1: pure metals.
- spec_trans - Set the fraction of light that passes through the material.

Here are some examples of different material parameters.

```
[12]: scene2 = fresnel.Scene(device)
spheres = []
for i in range(11):
    spheres.append(fresnel.geometry.Sphere(scene2, position = (i, 0, 0), radius=0.4))
    spheres[i].material = fresnel.material.Material(color=(.1, .7, .1))

tracer = fresnel.tracer.Path(device=device, w=1000, h=75)

scene2.lights = [fresnel.light.Light(direction=(1,1,-1), color=(0.5, 0.5, 0.5)),
                 fresnel.light.Light(direction=(-1,-1,1), color=(0.5, 0.5, 0.5))]
```

9.4.1 Examples

These examples are front lit from the lower left and back lit from the upper right.

Vary roughness in a specular material from 0.1 to 1.1

```
[13]: for i in range(11):
    spheres[i].material.specular = 1.0
    spheres[i].material.roughness = i/10+0.1

tracer.sample(scene2, samples=64, light_samples=40)
```

Vary specular from 0 to 1 with constant roughness.

```
[14]: for i in range(11):
    spheres[i].material.specular = i/10
    spheres[i].material.roughness = 0.1
    spheres[i].material.color=(.7, .1, .1)

tracer.sample(scene2, samples=64, light_samples=40)
```

The following examples use cloudy lighting which places a bright hemisphere of light above the scene and a dim hemisphere of light below the scene.

Vary metal from 0 to 1 with a rough material. (metal materials look best when there is other geometry to reflect from the surface)

```
[15]: for i in range(11):
        spheres[i].material.specular = 1.0
        spheres[i].material.color=(.7,.7,.7)
        spheres[i].material.metal = i/10

scene2.lights = fresnel.light.cloudy()
tracer.sample(scene2, samples=64, light_samples=40)
```

Vary spec_trans from 0 to 1 with all other quantities constant.

```
[16]: for i in range(11):
        spheres[i].material.metal = 0.0
        spheres[i].material.spec_trans = i/10
        spheres[i].material.color=(.1,.1,.7)

tracer.sample(scene2, samples=64, light_samples=40)
```

Execute this notebook with **ipywidgets** installed and use the panel below to explore the material parameters and how they react to different lighting angles.

```
[17]: import ipywidgets

tracer.resize(450,450)

@ipywidgets.interact (color=ipywidgets.ColorPicker(value='#1c1c7f'),
                      primitive_color_mix=ipywidgets.FloatSlider(value=0.0, min=0.0,
→max=1.0, step=0.1, continuous_update=False),
                      roughness=ipywidgets.FloatSlider(value=0.3, min=0.1, max=1.0,
→step=0.1, continuous_update=False),
                      specular=ipywidgets.FloatSlider(value=0.5, min=0.0, max=1.0,
→step=0.1, continuous_update=False),
                      spec_trans=ipywidgets.FloatSlider(value=0.0, min=0.0, max=1.0,
→step=0.1, continuous_update=False),
                      metal=ipywidgets.FloatSlider(value=0, min=0.0, max=1.0, step=1.0,
→ continuous_update=False),
                      light_theta=ipywidgets.FloatSlider(value=5.5, min=0.0,
→max=2*math.pi, step=0.1, continuous_update=False),
                      light_phi=ipywidgets.FloatSlider(value=0.8, min=0.0, max=math.pi,
→ step=0.1, continuous_update=False))
def test(color, primitive_color_mix, roughness, specular, spec_trans, metal, light_
→theta, light_phi):
    r = int(color[1:3], 16)/255;
    g = int(color[3:5], 16)/255;
    b = int(color[5:7], 16)/255;
    scene.lights[0].direction = (math.sin(light_phi)*math.cos(-light_theta),
                                math.cos(light_phi),
                                math.sin(light_phi)*math.sin(-light_theta))
```

(continues on next page)

(continued from previous page)

```
scene.lights[1].theta = math.pi
geometry.material = fresnel.material.Material(color=fresnel.color.linear([r,g,b]),
                                              primitive_color_mix=primitive_color_
↪mix,
                                              roughness=roughness,
                                              metal=metal,
                                              specular=specular,
                                              spec_trans=spec_trans
                                              )
return tracer.sample(scene, samples=64, light_samples=1)
```

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-examples](#) repository.

CHAPTER 10

Outline materials

Each **geometry** has an associated **outline material** and an **outline width**. The **outline material** has all the same attributes as a normal material, but it is only applied in a thin line around each geometry primitive. The width of that line is the **outline width**.

```
[1]: import fresnel
import math
scene = fresnel.Scene()
position = []
for k in range(5):
    for i in range(5):
        for j in range(5):
            position.append([2*i, 2*j, 2*k])
geometry = fresnel.geometry.Sphere(scene, position = position, radius=1.0)
geometry.color[:,4] = fresnel.color.linear([0.25,0.5,1])
geometry.color[1::4] = fresnel.color.linear([1,0.714,0.169])
geometry.color[2::4] = fresnel.color.linear([0.42,0.267,1])
geometry.color[3::4] = fresnel.color.linear([1,0.874,0.169])
geometry.material = fresnel.material.Material(solid=0.0, primitive_color_mix=1.0,
↪color=fresnel.color.linear([0,0,0]))
fresnel.light.cloudy();

[1]: [<fresnel.light.Light at 0x7f6a380e19e8>,
<fresnel.light.Light at 0x7f6a380a9358>]
```

10.1 Enabling outlines

The default **outline width** is 0. Set a non-zero outline width to enable the outlines.

```
[2]: geometry.outline_width
[2]: 0.0
```

The **outline width** is in distance units in the same coordinate system as scene. The is *width* units wide perpendicular to the view direction. Outlines enhance the separation between primitives visually. They work well with diffuse and solid colored primitives.

```
[3]: geometry.outline_width = 0.12
```

```
[4]: fresnel.pathtrace(scene, w=300, h=300, light_samples=40)
```

```
[4]:
```

```
[5]: geometry.material.solid = 1.0
```

```
[6]: fresnel.preview(scene, w=300, h=300, aa_level=3)
```

```
[6]:
```

10.2 Outline material properties

The default **outline material** is a solid black.

```
[7]: geometry.outline_material.color
```

```
[7]: (0.0, 0.0, 0.0)
```

```
[8]: geometry.outline_material.solid
```

```
[8]: 1.0
```

```
[9]: geometry.outline_material.primitive_color_mix
```

```
[9]: 0.0
```

The **outline material** has all the same properties as a normal material.

```
[10]: geometry.outline_material.color = fresnel.color.linear(fresnel.color.linear([0.08, 0.
↪ 341, 0.9]))
```

```
[11]: fresnel.preview(scene, w=300, h=300, aa_level=3)
```

```
[11]:
```

Outlines may be colored by the primitives:

```
[12]: geometry.material.primitive_color_mix = 0.0
geometry.outline_material.primitive_color_mix = 1.0
geometry.outline_width = 0.4
```

```
[13]: fresnel.preview(scene, w=300, h=300, aa_level=3)
```

[13]:

Outlines may have diffuse shading:

```
[14]: geometry.material.color = fresnel.color.linear([1,1,1])
       geometry.material.solid = 0
       geometry.outline_material.solid = 0
```

```
[15]: fresnel.pathtrace(scene, w=300, h=300, light_samples=40)
```

[15]:

Or be metallic:

```
[16]: geometry.material.color = fresnel.color.linear([0.08,0.341,0.9])
       geometry.outline_material.solid = 0
       geometry.outline_material.color = [0.95,0.95,0.95]
```

(continues on next page)

(continued from previous page)

```
geometry.outline_material.roughness = 0.1  
geometry.outline_material.metal = 1  
geometry.outline_material.primitive_color_mix = 0.0  
geometry.outline_width = 0.2
```

```
[17]: fresnel.pathtrace(scene, w=300, h=300, light_samples=40)
```

```
[17]:
```

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-examples](#) repository.

Scene properties

Each **Scene** has a **background color** and **alpha**, **lights**, and a **camera**.

```
[1]: import fresnel
import math
scene = fresnel.Scene()
position = []
for i in range(6):
    position.append([2*math.cos(i*2*math.pi / 6), 2*math.sin(i*2*math.pi / 6), 0])

geometry = fresnel.geometry.Sphere(scene, position = position, radius=1.0)
geometry.material = fresnel.material.Material(solid=0.0, color=fresnel.color.
↪linear([1,0.874,0.169]))
geometry.outline_width = 0.12
```

11.1 Background color and alpha

The default **background color** is black (0,0,0) and the **background alpha** is 0 (transparent).

```
[2]: scene.background_color
```

```
[2]: (0.0, 0.0, 0.0)
```

```
[3]: scene.background_alpha
```

```
[3]: 0.0
```

The background color is applied to any pixel in the output image where no object is present. Change the **background alpha** to only partially transparent:

```
[4]: scene.background_alpha = 0.5
```

```
[5]: fresnel.preview(scene, aa_level=3)
```

```
[5]:
```

Set a solid background color:

```
[6]: scene.background_alpha = 1.0  
     scene.background_color = fresnel.color.linear([0.592, 0.722, 0.98])
```

```
[7]: fresnel.preview(scene, aa_level=3)
```

[7]:

11.2 Light sources

Light sources light the objects in the scene. Without lights, all objects are black.

```
[8]: scene.lights.clear()
```

```
[9]: fresnel.preview(scene, aa_level=3)
```

[9]:

Fresnel defines several standard lighting setups that may be easily applied.

```
[10]: scene.lights = fresnel.light.butterfly()
```

```
[11]: fresnel.preview(scene, aa_level=3)
```

[11]:

You can modify individual lights.

```
[12]: scene.lights[0].direction = (-1, 0, 1)
```

```
[13]: fresnel.preview(scene, aa_level=3)
```

11.3 Camera

The camera defines the view to render into the scene. By default, the camera is `auto` and the camera is automatically selected to fit the scene every time it is rendered.

```
[14]: print(scene.camera)
```

```
auto
```

You can obtain the same camera explicitly with `camera.fit`. Call it **after** defining all of the geometry in your scene.

```
[15]: scene.camera = fresnel.camera.fit(scene)
```

A **camera** is defined by its *position*, *look-at point*, *up vector* and *height* of the view into the scene. All of these quantities are in scene coordinates.

```
[16]: scene.camera = fresnel.camera.orthographic(position=(0,0,2), look_at=(0,0,0), up=(0,1,
    ↪0), height=6)
fresnel.preview(scene, aa_level=3)
```

[16]:

You can modify these parameters individually.

```
[17]: scene.camera.position = (3, 0, 10)
      scene.camera.look_at=(3,0,0)
```

```
[18]: fresnel.preview(scene, aa_level=3)
```

[18]:

Print the full representation of the camera.

[19]: `print(repr(scene.camera))`

```
fresnel.camera.orthographic(position=(3.0, 0.0, 10.0), look_at=(3.0, 0.0, 0.0), up=(0.0, 1.0, 0.0), height=6.0)
```

You can copy and paste this text to reproduce the same camera elsewhere.

```
[20]: scene.camera = fresnel.camera.orthographic(position=(3.0, 0.0, 10.0),
                                                look_at=(3.0, 0.0, 0.0),
                                                up=(0.0, 1.0, 0.0),
                                                height=6.0)
```

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-examples](#) repository.

CHAPTER 12

Lighting setups

Each **Scene** has associated **lights**. The lights control how the objects in a scene is lit.

```
[1]: import fresnel
import math
import matplotlib, matplotlib.cm
from matplotlib import pyplot
%matplotlib inline
import numpy

device = fresnel.Device()
scene = fresnel.Scene(device)
position = []
for k in range(5):
    for i in range(5):
        for j in range(5):
            position.append([2*i, 2*j, 2*k])
geometry = fresnel.geometry.Sphere(scene, position = position, radius=1.0)
geometry.material = fresnel.material.Material(primitive_color_mix=1.0, color=(1,1,1))
mapper = matplotlib.cm.ScalarMappable(norm = matplotlib.colors.Normalize(vmin=0,
↪vmax=1, clip=True),
                                     cmap = matplotlib.cm.get_cmap(name='viridis'))

v = numpy.linspace(0,1,len(position))
geometry.color[:] = fresnel.color.linear(mapper.to_rgba(v))
scene.camera = fresnel.camera.fit(scene, view='isometric')
tracer = fresnel.tracer.Path(device, w=450, h=450)
```

12.1 Lighting presets

Fresnel defines many lighting presets that use classic photography techniques to light the scene. Create a setup and assign it to the Scene's lights.

The images in these examples are noisy because of the small number of samples. Increase the number of samples to obtain less noisy images.

12.1.1 Light box

A light box lights the scene equally from all sides. This type of lighting is commonly used product photography.

```
[2]: scene.lights = fresnel.light.lightbox()  
tracer.sample(scene, samples=64, light_samples=10)
```

[2]:

12.1.2 Cloudy

Cloudy lighting mimics a cloudy day. Strong light comes from all directions above, while weak light comes from below.

```
[3]: scene.lights = fresnel.light.cloudy()  
tracer.sample(scene, samples=64, light_samples=10)
```

[3]:

12.1.3 Rembrandt

Rembrandt lighting places the key light 45 degrees to one side and slightly up.

```
[4]: scene.lights = fresnel.light.rembrandt()  
tracer.sample(scene, samples=64, light_samples=10)
```

[4]:

Use the *side* argument specify which side to place the key light on.

```
[5]: scene.lights = fresnel.light.rembrandt(side='left')
      tracer.sample(scene, samples=64, light_samples=10)
```

[5]:

12.1.4 Loop lighting

Loop lighting places the key light slightly to one side and slightly up.

```
[6]: scene.lights = fresnel.light.loop()  
tracer.sample(scene, samples=64, light_samples=10)
```

[6]:

12.1.5 Butterfly lighting

Butterfly lighting places the key light high above the camera.

```
[7]: scene.lights = fresnel.light.butterfly()  
tracer.sample(scene, samples=64, light_samples=10)
```

[7]:

12.1.6 Ring lighting

The ring lighting setup provides a strong front area light. This type of lighting is common in fashion photography.

```
[8]: scene.lights = fresnel.light.ring()  
tracer.sample(scene, samples=64, light_samples=10)
```

[8]:

12.2 Custom lights

You can define your own custom lights. Provide a *direction* vector pointing to the light in the coordinate system of the camera (+x points to the right, +y points up, and +z points out of the screen). The light color defines both the color (RGB) and the intensity of the light in a linear sRGB color space.

```
[9]: my_lights = [fresnel.light.Light(direction=(1,-1,1), color=(1,1,1))]  
scene.lights = my_lights
```

```
[10]: tracer.sample(scene, samples=64, light_samples=10)
```

```
[10]:
```

The shadows are very dark. Add another light to fill them in. You can access the scene's lights directly. The value *theta* defines the half angle width of the light source. Large lights provide soft shadows.

```
[11]: scene.lights.append(fresnel.light.Light(direction=(0,0,1), color=(1,1,1), theta=3.14))
      tracer.sample(scene, samples=64, light_samples=10)
```

[11]:

This image is overexposed.

Highlight warnings show overexposed areas of the image as a special color (default: magenta).

```
[12]: tracer.enable_highlight_warning()  
      tracer.render(scene)
```

[12]:

If the histogram is blocking up at 1.0, there are overexposed highlights.

```
[13]: L, bins = tracer.histogram()
pyplot.fill_between(bins, L[:,3], color='blue');
pyplot.fill_between(bins, L[:,2], color='green');
pyplot.fill_between(bins, L[:,1], color='red');
pyplot.fill_between(bins, L[:,0], color='gray');
```

Reduce the intensity of the light to correctly expose the image.

```
[14]: scene.lights[1].color=(0.45,0.45,0.45)
      tracer.sample(scene, samples=64, light_samples=10)
```

```
[14]:
```

Now there are no clipping warnings and the histogram shows a perfectly exposed image.

```
[15]: L, bins = tracer.histogram()
      pyplot.fill_between(bins, L[:,3], color='blue');
      pyplot.fill_between(bins, L[:,2], color='green');
      pyplot.fill_between(bins, L[:,1], color='red');
      pyplot.fill_between(bins, L[:,0], color='gray');
```

`scene.lights` has typical sequence like behavior. You can assign a sequence of `Light` objects to it, append lights to it, and loop over the lights in it. For example, reverse the direction of every light:

```
[16]: for l in scene.lights:
      d = l.direction;
      l.direction = (-d[0], -d[1], -d[2])
```

```
[17]: scene.lights[1].color=(0.05,0.05,0.05)
      tracer.disable_highlight_warning()
      tracer.sample(scene, samples=64, light_samples=10)
```

[17]:

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-examples](#) repository.

Sphere

```
[1]: import fresnel
scene = fresnel.Scene()
```

The **sphere geometry** defines a set of N spheres. Each sphere has its own *position*, *radius*, and *color*.

```
[2]: geometry = fresnel.geometry.Sphere(scene, N=3)
geometry.material = fresnel.material.Material(color=fresnel.color.linear([0.25, 0.5, 0.
↪ 9]),
                                             roughness=0.8)
```

13.1 Geometric properties

position defines the position of each sphere.

```
[3]: geometry.position[:] = [[-2, 0, 0], [0, 0, 0], [3, 0, 0]]
```

radius sets the radius of each sphere.

```
[4]: geometry.radius[:] = [0.5, 1.0, 1.5]
```

```
[5]: scene.camera = fresnel.camera.fit(scene, view='front', margin=0.5)
fresnel.preview(scene, aa_level=3)
```

[5]:

13.2 Color

color sets the color of each sphere (when when *primitive_color_mix* > 0)

```
[6]: geometry.color[:] = fresnel.color.linear([[0.9,0,0], [0, 0.9, 0], [0, 0, 0.9]])  
      geometry.material.primitive_color_mix = 1.0
```

```
[7]: fresnel.preview(scene, aa_level=3)
```

[7]:

13.3 Outlines

Outlines are applied on the outer edge of the sphere in the view plane.

```
[8]: geometry.outline_width = 0.05
```

```
[9]: fresnel.preview(scene, aa_level=3)
```

[9]:

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-examples](#) repository.

```
[1]: import fresnel
     scene = fresnel.Scene()
```

The **cylinder geometry** defines a set of N spherocylinders. Each spherocylinder is defined by two end points and has its own *radius*, and end point *colors*.

```
[2]: geometry = fresnel.geometry.Cylinder(scene, N=3)
     geometry.material = fresnel.material.Material(color=fresnel.color.linear([0.25, 0.5, 0.
     ↪ 9]),
                                                roughness=0.8)
```

14.1 Geometric properties

points defines the end points of each cylinder.

```
[3]: geometry.points[:] = [[[-5, -1, -1], [-2, 1, 1]],
                           [[1, -2, 1], [0, 2, -1]],
                           [[5, -1.5, 2], [3, 1.5, -2]]]
```

radius sets the radius of each spherocylinder.

```
[4]: geometry.radius[:] = [0.5, 1.0, 1.5]
```

```
[5]: scene.camera = fresnel.camera.fit(scene, view='front', margin=0.5)
     fresnel.preview(scene, aa_level=3)
```

[5]:

14.2 Color

color sets the color of the end points of each cylinder (when *primitive_color_mix* > 0). The color transitions at the midpoint.

```
[6]: geometry.color[:] = [[[0.9, 0, 0], [0.9, 0, 0]],  
                        [[0, 0.9, 0], [0, 0.9, 0.9]],  
                        [[0.9, 0.9, 0], [0, 0, 0.9]]]  
      geometry.material.primitive_color_mix = 1.0
```

```
[7]: fresnel.preview(scene, aa_level=3)
```

```
[7]:
```

14.3 Outlines

Outlines are applied on the outer edge of the cylinder in the view plane.

```
[8]: geometry.outline_width = 0.05
```

```
[9]: fresnel.preview(scene, aa_level=3)
```

[9]:

Convex polyhedron

```
[1]: import fresnel
import itertools
import math
import numpy as np
device = fresnel.Device()
scene = fresnel.Scene(device)
```

The **convex polyhedron geometry** defines a set of N convex polyhedra. The shape of all N polyhedra is identical and defined by P planes. Each polyhedron has its own *position*, *orientation*, and *color*. You must also specify the circumsphere radius r . Note that the information used to draw a convex polyhedron is easily obtained from its vertices via the `util.convex_polyhedron_from_vertices()` utility function.

To construct a truncated cube:

```
[2]: # first get cube verts
pm = [-1, 1]
cube_verts = list(itertools.product(pm, repeat=3))
trunc_cube_verts = []
# truncate by removing corners and adding vertices to edges
for p1, p2 in itertools.combinations(cube_verts, 2):
    # don't add points along any diagonals
    match = (p1[0]==p2[0], p1[1]==p2[1], p1[2]==p2[2])
    if match.count(False) == 1: # only 1 coordinate changes, not a diagonal
        p1, p2 = np.array(p1), np.array(p2)
        vec = p2 - p1
        trunc_cube_verts.append(p1 + vec/3)
        trunc_cube_verts.append(p1 + 2*vec/3)

[3]: c1 = fresnel.color.linear([0.70, 0.87, 0.54])*0.8
c2 = fresnel.color.linear([0.65, 0.81, 0.89])*0.8
colors = {8: c1, 3: c2}
poly_info = fresnel.util.convex_polyhedron_from_vertices(trunc_cube_verts)
for idx, fs in enumerate(poly_info['face_sides']):
    poly_info['face_color'][idx] = colors[fs]
```

(continues on next page)

(continued from previous page)

```

geometry = fresnel.geometry.ConvexPolyhedron(scene,
                                             poly_info,
                                             N=3
                                             )
geometry.material = fresnel.material.Material(color=fresnel.color.linear([0.25,0.5,0.
↪9])),
                                             roughness=0.8)

```

15.1 Geometric properties

position defines the position of the center of each convex polyhedron.

```
[4]: geometry.position[:] = [[-3,0,0], [0, 0, 0], [3, 0, 0]]
```

orientation sets the orientation of each convex polyhedron as a quaternion

```
[5]: geometry.orientation[:] = [[1, 0, 0, 0],
                                [0.80777943, 0.41672122, 0.00255412, 0.41692838],
                                [0.0347298, 0.0801457, 0.98045, 0.176321]]
```

```
[6]: scene.camera = fresnel.camera.fit(scene, view='front', margin=0.8)
fresnel.preview(scene, aa_level=3)
```

```
[6]:
```

15.2 Color

color sets the color of each individual convex polyhedron (when *primitive_color_mix* > 0 and *color_by_face* < 1)

```
[7]: geometry.color[:] = fresnel.color.linear([[0.9,0,0], [0, 0.9, 0], [0, 0, 0.9]])  
      geometry.material.primitive_color_mix = 1.0  
      fresnel.preview(scene, aa_level=3)
```

[7]:

Set **color_by_face** > 0 to color the faces of the polyhedra independently. `poly_info['face_colors']` (i.e., the output of `convex_polyhedron_from_vertices`, which we modified above) sets the color of each face. Above, we set the color of the each face based on number of sides it has.

```
[8]: geometry.color_by_face = 1.0  
      fresnel.preview(scene, aa_level=3)
```

[8]:

15.3 Outlines

Outlines are applied at the outer edge of each face.

```
[9]: geometry.outline_width = 0.02
fresnel.preview(scene, aa_level=3)
```

[9]:

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-examples](#) repository.

```
[1]: import fresnel
import numpy
import matplotlib, matplotlib.cm
```

The **mesh geometry** defines a generic triangle mesh. Define a mesh with an $3 \times T$ array where T is the number of triangles. Triangles must be specified with a counter clockwise winding. Here is the [Stanford bunny](https://graphics.stanford.edu/~mdfisher/Data/Meshes/bunny.obj) as an example:

```
[2]: # https://graphics.stanford.edu/~mdfisher/Data/Meshes/bunny.obj
verts = numpy.load('bunny.npy')
```

16.1 Geometric properties

Pass the vertices to the mesh geometry.

```
[3]: scenel = fresnel.Scene()
bunny = fresnel.geometry.Mesh(scenel, vertices=verts, N=1)
```

```
[4]: bunny.material = fresnel.material.Material(color=fresnel.color.linear([0.25, 0.5, 0.9]),
↪ roughness=0.6)
scenel.camera = fresnel.camera.fit(scenel, margin=0)
scenel.lights = fresnel.light.cloudy()
fresnel.pathtrace(scenel, samples=200)
```

[4]:

Specify position and orientation to instantiate the mesh many times.

```
[5]: scene2 = fresnel.Scene()
bunnies = fresnel.geometry.Mesh(scene2, vertices=verts, N=2)
bunnies.position[:] = [[0,0,0], [-0.11,0,0.1]]
bunnies.orientation[:] = [[1,0,0,0], [0,0,1,0]]

[6]: bunnies.material = fresnel.material.Material(color=fresnel.color.linear([0.25,0.5,0.
↪9]), roughness=0.6)
scene2.camera = fresnel.camera.fit(scenel, margin=0)
scene2.lights = fresnel.light.cloudy()
fresnel.pathtrace(scene2, samples=200)
```

[6]:

16.2 Color

Specify per vertex colors. These colors are smoothly interpolated across the triangles. Set `primitive_color_mix=1` to choose the per-vertex colors.

Color the bunny based on the y-coordinate of the mesh:

```
[7]: mapper = matplotlib.cm.ScalarMappable(norm = matplotlib.colors.Normalize(vmin=-0.08, ↵
    ↪vmax=0.05, clip=True),
                                     cmap = matplotlib.cm.get_cmap(name='viridis'))

bunny.color[:] = fresnel.color.linear(mapper.to_rgba(verts[:,1]))
bunny.material.primitive_color_mix = 1.0
```

```
[8]: fresnel.pathtrace(scenel, samples=200)
```

[8]:

Here is a single triangle demo to demonstrate the interpolation:

```
[9]: scene3 = fresnel.Scene()
triangle = fresnel.geometry.Mesh(scene3, vertices=[[0,0,0],[1,0,0],[0,1,0]], N=1)
triangle.material.solid = 1
triangle.material.primitive_color_mix = 1.0
triangle.color[:] = [[1,0,0], [0,1,0], [0,0,1]]
```

```
[10]: scene3.camera = fresnel.camera.fit(scene3, view='front')
fresnel.preview(scene3, aa_level=3)
```

```
[10]:
```

16.3 Outlines

Outlines are placed on the outer edge of each triangle in the mesh.

```
[11]: triangle.outline_width=0.01  
fresnel.preview(scene3, aa_level=3)
```

```
[11]:
```

```
[12]: bunny.outline_width=0.0002  
      scenel.camera.height *= 0.5  
      fresnel.pathtrace(scenel, samples=200)
```

```
[12]:
```

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-](#)

examples repository.

```
[1]: import fresnel
scene = fresnel.Scene()
```

The **polygon geometry** defines a set of N simple polygons in two dimensions. All polygons in the geometry have the same vertices. Each polygon has a separate *position*, orientation *angle*, and *color*.

```
[2]: geometry = fresnel.geometry.Polygon(scene,
                                         N=2,
                                         vertices = [[0, -1], [1, 1],
                                                    [0, 0.5], [-1, 1]])
geometry.material.color = fresnel.color.linear([0.20,0.64,0.58])
geometry.material.solid=1
```

17.1 Geometric properties

position defines the position of each polygon in the $z=0$ plane.

```
[3]: geometry.position[:] = [[-1,0],
                             [1, 0]]
```

angle defines the rotation angle of each polygon

```
[4]: geometry.angle[:] = [0.1, -1.0]
```

```
[5]: fresnel.preview(scene, aa_level=3)
```

[5]:

17.2 Color

color sets the color of each polygon (when *primitive_color_mix* > 0).

```
[6]: geometry.color[:] = [fresnel.color.linear([0.02,0.23,0.42]),  
                           fresnel.color.linear([0.38,0.84,0.98])];  
geometry.material.primitive_color_mix = 1.0
```

```
[7]: fresnel.preview(scene, aa_level=3)
```

[7]:

17.3 Outlines

Outlines are applied inside the outer edge of the polygon in the $z=0$ plane.

```
[8]: geometry.outline_width = 0.05
```

```
[9]: fresnel.preview(scene, aa_level=3)
```

[9]:

17.4 Rounded polygons

Specify *rounding_radius* to round the edges of the polygon.

```
[10]: scene2 = fresnel.Scene()
geometry2 = fresnel.geometry.Polygon(scene2,
                                     rounding_radius=0.3,
                                     N=1,
                                     vertices = [[-1, -1], [1, -1],
                                                  [1, 1], [-1, 1]],
                                     outline_width=0.1)
geometry2.material.color=fresnel.color.linear([0.56,0.03,0.28])
geometry2.material.solid=1
```

```
[11]: fresnel.preview(scene2, aa_level=3)
```

[11]:

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-examples](#) repository.

Multiple geometries

A **Scene** may consist of more than one geometry object. For fast performance, try to condense the scene down to as few geometries with as many primitives as possible. Multiple geometries allow for different materials to be applied to the same type of geometry and for different types of geometry in the same scene.

```
[1]: import fresnel
scene = fresnel.Scene()
```

18.1 Create multiple geometries

To create multiple geometries, instantiate several instances of the geometry class.

```
[2]: geom1 = fresnel.geometry.Sphere(scene, position = [[-3.2, 1, 0], [-3.2, -1, 0], [-1.2,
↪ 1, 0], [-1.2, -1, 0]], radius=1.0)
geom1.material = fresnel.material.Material(solid=1.0, color=fresnel.color.linear([0.
↪ 42, 0.267, 1]))
geom1.outline_width = 0.12
```

```
[3]: geom2 = fresnel.geometry.Sphere(scene, position = [[3.2, 1, 0], [3.2, -1, 0], [1.2, 1,
↪ 0], [1.2, -1, 0]], radius=1.0)
geom2.material = fresnel.material.Material(solid=0.0, color=fresnel.color.linear([1, 0.
↪ 874, 0.169]))
```

```
[4]: fresnel.preview(scene, w=900, h=370, aa_level=3)
```

[4]:

18.2 Disable geometries

disable a geometry to prevent it from appearing in the scene.

```
[5]: geom1.disable()
```

```
[6]: fresnel.preview(scene, w=900, h=370, aa_level=3)
```

[6]:

enable the geometry to make it appear again.

```
[7]: geom1.enable()
```

```
[8]: fresnel.preview(scene, w=900, h=370, aa_level=3)
```

```
[8]:
```

18.3 Remove geometry

Call **remove** to completely remove a geometry instance from the scene. It cannot be added back.

```
[9]: geom2.remove()
```

```
[10]: fresnel.preview(scene, w=900, h=370, aa_level=3)
```

```
[10]:
```

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-examples](#) repository.

Each **Scene** is attached to a specific **Device**. The **Device** controls what hardware the ray tracing executes on. **Scene** implicitly creates a default **Device** when you do not specify one.

19.1 The default device

The default device automatically selects **GPU ray tracing** if the *gpu module is compiled and there is at least one gpu present in the system* - otherwise it selects **CPU ray tracing**.

```
[1]: import fresnel
device = fresnel.Device()
```

19.2 Query available execution modes

The `available_modes` static variable lists which execution modes are available. This will vary based on compile time options and whether there is a GPU present in the system.

```
[2]: print(fresnel.Device.available_modes)

['gpu', 'cpu', 'auto']
```

`available_gpus` lists the GPUs available for rendering in the system.

```
[3]: for g in fresnel.Device.available_gpus:
      print(g)

[0]:          Quadro GP100    56 SM_6.0 @ 1.44 GHz,  8276 MiB DRAM
[1]:          Quadro GP100    56 SM_6.0 @ 1.44 GHz,  8276 MiB DRAM
```

19.3 Choose execution hardware

Explicitly manage a **Device** to control what hardware the ray tracing executes on. Converting the device to a string provides a short summary of the device configuration.

```
[4]: gpu = fresnel.Device(mode='gpu')
     print(gpu)

<fresnel.Device: Enabled OptiX devices:
  [0]:          Quadro GP100    56 SM_6.0 @ 1.44 GHz,   8276 MiB DRAM
  [1]:          Quadro GP100    56 SM_6.0 @ 1.44 GHz,   8276 MiB DRAM
>
```

```
[5]: cpu = fresnel.Device(mode='cpu')
     print(cpu)

<fresnel.Device: All available CPU threads>
```

Set `n` to specify how many CPU threads or GPUs to use in parallel. By default, a device will use all available CPU cores or GPUs in the system.

```
[6]: cpu_limit = fresnel.Device(mode='cpu', n=6)
     print(cpu_limit)

<fresnel.Device: 6 CPU threads>
```

19.4 Attach a scene to a device

Each **Scene** must be attached to a device when created.

```
[7]: scene_gpu = fresnel.Scene(device=gpu)
```

```
[8]: scene_cpu = fresnel.Scene(device=cpu)
```

These two scenes have the same API, but different implementations.

```
[9]: for scene in [scene_cpu, scene_gpu]:
     geometry = fresnel.geometry.Sphere(scene, N=8, radius=1.0)
     geometry.position[:] = [[1,1,1],
                             [1,1,-1],
                             [1,-1,1],
                             [1,-1,-1],
                             [-1,1,1],
                             [-1,1,-1],
                             [-1,-1,1],
                             [-1,-1,-1]]
     geometry.material = fresnel.material.Material(color=fresnel.color.linear([0.25,0.
     ↪5,1]))
```

Rendered output is essentially identical from the two devices.

```
[10]: fresnel.preview(scene_gpu, w=300, h=300, aa_level=3)
```

```
[10]:
```

```
[11]: fresnel.preview(scene_cpu, w=300, h=300, aa_level=3)
```

```
[11]:
```

19.5 Memory consumption

Each **Device** consumes memory by itself. When maintaining multiple scenes, attach them all to the same device to reduce memory consumption.

```
[12]: import math
scene2_gpu = fresnel.Scene(device=gpu)
position = []
for k in range(5):
    for i in range(5):
```

(continues on next page)

(continued from previous page)

```
for j in range(5):
    position.append([2*i, 2*j, 2*k])
geometry = fresnel.geometry.Sphere(scene2_gpu, position = position, radius=1.0)
geometry.color[:4] = fresnel.color.linear([0.25,0.5,1])
geometry.color[1::4] = fresnel.color.linear([1,0.714,0.169])
geometry.color[2::4] = fresnel.color.linear([0.42,0.267,1])
geometry.color[3::4] = fresnel.color.linear([1,0.874,0.169])
geometry.material = fresnel.material.Material(solid=0.0, primitive_color_mix=1.0)
```

```
[13]: fresnel.preview(scene2_gpu, w=300, h=300, aa_level=3)
```

```
[13]:
```

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-examples](#) repository.

Most of the tutorials use `fresnel.preview()` and `fresnel.pathtrace()` to render output images. This is a convenience API, and there are cases where it is not appropriate. To render many frames, such as in a movie or interactive visualization, use a **Tracer** directly to avoid overhead.

```
[1]: import fresnel
import math
from matplotlib import pyplot
%matplotlib inline
device = fresnel.Device()
scene = fresnel.Scene(device=device)
position = []
for i in range(6):
    position.append([2*math.cos(i*2*math.pi / 6), 2*math.sin(i*2*math.pi / 6), 0])

geometry = fresnel.geometry.Sphere(scene, position = position, radius=1.0)
geometry.material = fresnel.material.Material(solid=0.0, color=fresnel.color.
↪linear([1,0.874,0.169])*0.9)
geometry.outline_width = 0.12
scene.camera = fresnel.camera.fit(scene, view='front', margin=0.2)
```

20.1 Common Tracer operations

The **Tracer** must use the same device as the **Scenes** it renders. Each **Tracer** maintains an output image, and the width **w** and height **h** must be defined when the tracer is created.

```
[2]: tracer = fresnel.tracer.Preview(device=device, w=300, h=300, aa_level=3)
```

20.1.1 Rendering and accessing output images

The **render** method renders the output.

```
[3]: out = tracer.render(scene)
```

The return value of **render** is a proxy reference to the internal image buffer of the **Tracer**. You can access with a **numpy** array like interface.

```
[4]: out[100,100]
```

```
[4]: array([139, 121,  21, 255], dtype=uint8)
```

The output object also provides an interface for **jupyter** to display the image.

```
[5]: out
```

```
[5]:
```

tracer.output also accesses the output buffer.

```
[6]: tracer.output
```

```
[6]:
```

The tracer can render a modified scene without the initialization overhead.

```
[7]: scene.camera.up = (1,0,0)
     tracer.render(scene);
```

After rendering, existing references to the output buffer will access the newly rendered image.

```
[8]: out
```

```
[8]:
```

20.1.2 Evaluate image exposure

Tracer provides several methods to evaluate image exposure. Enable highlight warnings to flag overexposed pixels in the output image.

```
[9]: tracer.enable_highlight_warning()
```

The test image is exposed correctly, there are no warning pixels.

```
[10]: tracer.render(scene)
```

```
[10]:
```

Make the main light brighter to show the highlight warnings.

```
[11]: scene.lights[0].color = (1.2, 1.2, 1.2)
      tracer.render(scene)
```

```
[11]:
```

Tracer can also compute the image histogram to evaluate image exposure.

```
[12]: L, bins = tracer.histogram()
      pyplot.fill_between(bins, L[:,3], color='blue');
      pyplot.fill_between(bins, L[:,2], color='green');
      pyplot.fill_between(bins, L[:,1], color='red');
      pyplot.fill_between(bins, L[:,0], color='gray');
      pyplot.axis(ymax=400, ymin=0)
```

```
[12]: (-0.04794921875, 1.04990234375, 0, 400)
```

```
[13]: tracer.disable_highlight_warning()
```

20.1.3 Resizing the output buffer

Call **resize** to set a new size for the output. When the image is resized, any existing rendered output is lost.

```
[14]: tracer.resize(w=150, h=150)
```

```
[15]: tracer.output
```

```
[15]:
```

The next call to render will render into the new output size.

```
[16]: tracer.render(scene)
```

```
[16]:
```

20.2 The Preview tracer

The **Preview** tracer renders output images quickly with approximate lighting effects.

```
[17]: tracer = fresnel.tracer.Preview(device=device, w=300, h=300)
```

The *aa_level* attribute controls the strength of the anti-aliasing.

```
[18]: tracer.aa_level
```

```
[18]: 0
```

```
[19]: tracer.render(scene)
```

```
[19]:
```

```
[20]: tracer.aa_level = 1
```

```
[21]: tracer.render(scene)
```

```
[21]:
```

```
[22]: tracer.aa_level = 3
```

```
[23]: tracer.render(scene)
```

```
[23]:
```

A different random number seed will result in different jittered anti-aliasing samples.

```
[24]: tracer.seed = 12  
      tracer.aa_level = 1
```

```
[25]: tracer.render(scene)
```

[25]:

Here is a different scene rendered with the **Preview** tracer:

```
[28]: position = []
      for k in range(5):
          for i in range(5):
              for j in range(5):
                  position.append([2*i, 2*j, 2*k])
      scene = fresnel.Scene(device)
      scene.lights[1].theta = math.pi

      geometry = fresnel.geometry.Sphere(scene, position = position, radius=1.0)
      geometry.material = fresnel.material.Material(color=fresnel.color.linear([0.1,0.1,0.
↪4]),
                                                    roughness=0.1,
                                                    specular=1.0)

[29]: tracer.resize(w=450, h=450)
      tracer.aa_level = 3
      tracer.render(scene)
```

[29]:

20.3 The Path tracer

The **Path** tracer supports soft lighting, reflections, and other lighting effects.

Here is the same scene with the path tracer:

```
[30]: path_tracer = fresnel.tracer.Path(device=device, w=450, h=450)
```

```
[31]: path_tracer.sample(scene, samples=64, light_samples=40)
```

[31]:

The **Path** tracer performs many independent samples and averages them together. **reset()** starts averaging a new image.

[32]: `path_tracer.reset()`

render() accumulates a single sample into the resulting image.

[33]: `path_tracer.render(scene)`

[33]:

The resulting image is noisy, average many samples together to obtain a clean image.

```
[34]: for i in range(64):  
        path_tracer.render(scene)  
  
path_tracer.output
```

[34]:

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-examples](#) repository.

```
[1]: import fresnel
import math
```

Interactive scene view

fresnel provides a Qt widget to interactively display scenes rendered with the **path tracer**. This is implemented with the **PySide2** library. Using jupyter support for this library, you can open an interactive window outside of the browser and interact with it from the jupyter notebook.

First, initialize jupyter's pyside2 integration.

```
[2]: from PySide2 import QtCore
      %gui qt
```

Then, import `fresnel.interact`. This **must** be done after `%gui qt`.

```
[3]: import fresnel.interact
```

Build a scene

```
[4]: position = []
      for k in range(5):
          for i in range(5):
              for j in range(5):
                  position.append([2*i, 2*j, 2*k])
      scene = fresnel.Scene()
      scene.lights[1].theta = math.pi

      geometry = fresnel.geometry.Sphere(scene, position = position, radius=1.0)
      geometry.material = fresnel.material.Material(color=fresnel.color.linear([0.1, 0.1, 0.1,
      ↪8]),
                                                    roughness=0.1,
                                                    specular=1.0)
```

21.1 SceneView widget

Create a `interact.SceneView` widget to visualize the scene.

```
[5]: view = fresnel.interact.SceneView(scene)
```

When the SceneView is the result of a cell, the window shows and gets focus.

```
[6]: view
```

```
[6]: <fresnel.interact.SceneView at 0x11872f288>
```

In the new window, you can click and drag to rotate the camera. Jupyter is still running so you can query changes to the window here. For example, after rotating the camera, inspect the new camera configuration:

```
[9]: repr(scene.camera)
```

```
[9]: 'fresnel.camera.orthographic(position=(13.338582992553711, 5.879554748535156, 4.
↪090480327606201), look_at=(4.0, 4.0, 4.0), up=(-0.17314134538173676, 0.
↪8814100027084351, -0.4394752085208893), height=10.116935729980469) '
```

After you change scene properties, call `setScene` to re-render the scene with the changes. For example: change the material color.

```
[8]: geometry.material.color = fresnel.color.linear([0.8,0.1,0.1])
view.setScene(scene)
```

This page was generated from a [jupyter](#) notebook. You can download and run the notebook locally from the [fresnel-examples](#) repository.

Overview

<code>fresnel.Device</code>	Hardware device to use for ray tracing.
<code>fresnel.Scene</code>	Content of the scene to ray trace.

Details

The fresnel ray tracing package.

`fresnel.__version__`
Fresnel version

Type `str`

class `fresnel.Device` (*mode*='auto', *n*=None)
Hardware device to use for ray tracing.

Parameters

- **mode** (*str*) – Specify execution mode: Valid values are `auto`, `gpu`, and `cpu`.
- **n** (*int*) – Specify the number of `cpu` threads / `gpus` this device will use. *None* sets no limit.

Device defines hardware device to use for ray tracing. *Scene* and *tracer* instances must be attached to a *Device*. You may attach any number of scenes and tracers to a single *Device*.

See also:

Devices Tutorial: Using devices.

Tracer methods Tutorial: Using tracers with devices.

When *mode* is `auto`, the default, *Device* GPU rendering and fall back on CPU rendering if there is no GPU available or GPU support was not compiled in. Set *mode* to `gpu` or `cpu` to force a specific mode.

Important: By default (`n=None`), this device will use all available GPUs or CPU cores. Set *n* to the number of GPUs or CPU cores this device should use. When selecting *n* GPUs, the device selects the first *n* in the `available_gpus` list.

Tip: Use only a single *Device* to reduce memory consumption.

The static member `available_modes` lists which modes are available. For a mode to be available, the corresponding module must be enabled at compile time. Additionally, there must be at least one GPU present for the `gpu` mode to be available.

```
>>> fresnel.Device.available_modes
['gpu', 'cpu', 'auto']
```

available_modes

List of the available execution modes (static member).

Type `list`

available_gpus

List of the available gpus (static member).

Type `list`

mode

The active mode

Type `str`

class `fresnel.Scene` (*device=None*, *camera='auto'*, *lights=[<fresnel.light.Light object>, <fresnel.light.Light object>]*)

Content of the scene to ray trace.

Parameters *device* (*Device*) – Device to create this Scene on.

Scene defines the contents of the scene to be ray traced, including any number of *geometry* objects, the *camera*, *background color*, *background alpha*, and the *lights*.

Every *Scene* attaches to a *Device*. For convenience, *Scene* creates a default *Device* when *device* is *None*. If you want a non-default device, you must create it explicitly.

See also:

Introduction Tutorial: Introduction to scenes

Scene properties Tutorial: Setting scene properties.

Lighting setups Tutorial: Using lighting setups with scenes.

Devices Tutorial: Using devices.

Lights

lights is a sequence of up to 4 directional lights that apply to the scene globally. Each light has a direction and color. You can assign lights using one of the predefined setups:

```
scene.lights = fresnel.light.butterfly()
```

You can assign a sequence of *Light* objects:

```
scene.lights = [fresnel.light.Light(direction=(1,2,3))]
```

You can modify the lights in place:

```
>>> print(len(scene.lights))
2
>>> l.append(fresnel.light.Light(direction=(1,0,0), color=(1,1,1)))
>>> print(len(l))
3
>>> print(l[2].direction)
(1,0,0)
>>> l[0].direction = (-1,0,0)
>>> print(l[0].direction)
(-1,0,0)
```

device

Device this Scene is attached to.

Type *Device*

camera

Camera view parameters, or 'auto' to automatically choose a camera.

Type *camera.Camera*

background_color

Background color (r,g,b) as a tuple or other 3-length python object, in the linearized color space. Use *fresnel.color.linear()* to convert standard sRGB colors

Type *tuple[float]*

background_alpha

Background alpha (opacity).

Type *float*

lights

Globals lights in the scene.

Type *list[light.Light]*

get_extents()

Get the extents of the scene

Returns [[minimum x, minimum y, minimum z], [maximum x, maximum y, maximum z]]

fresnel.pathtrace(scene, w=600, h=370, samples=64, light_samples=1)

Path trace a scene.

Parameters

- **scene** (*Scene*) – Scene to render.
- **w** (*int*) – Output image width.
- **h** (*int*) – Output image height.
- **samples** (*int*) – Number of times to sample the pixels of the scene.
- **light_samples** (*int*) – Number of light samples to take for each pixel sample.

pathtrace() is a shortcut to rendering output with the *Path* tracer. See the *Path* tracer for a complete description.

```
fresnel.preview(scene, w=600, h=370, aa_level=0)
```

Preview a scene.

Parameters

- **scene** (*Scene*) – Scene to render.
- **w** (*int*) – Output image width.
- **h** (*int*) – Output image height.
- **aa_level** (*int*) – Amount of anti-aliasing to perform

`preview()` is a shortcut to rendering output with the *Preview* tracer. See the *Preview* tracer for a complete description.

Modules

22.1 fresnel.camera

Overview

`fresnel.camera.Camera`

`fresnel.camera.fit`

`fresnel.camera.orthographic`

Details

Cameras.

```
class fresnel.camera.Camera(_camera=None)
```

Defines the view into the *Scene*.

Use one of the creation functions to create a *Camera*:

- `orthographic()`

See also:

Scene properties Tutorial: Setting scene properties

TODO: More advanced camera tutorials (when more advance camera functions are available)

The camera is a property of the *Scene*. You may read and modify any of these camera attributes.

position

the position of the camera (the center of projection).

Type `tuple[float, float, float]`

look_at

the point the camera looks at (the center of the focal plane).

Type `tuple[float, float, float]`

up

a vector pointing up.

Type `tuple[float, float, float]`

height

the height of the image plane.

Type `float`

basis

three orthonormal vectors defining the camera coordinate basis in the right-handed order right, look direction, up (read only)

Camera space is a coordinate system centered on the camera's position. Positive *x* points to the right in the image, positive *y* points up, and positive *z* points out of the screen. *Camera* space shares units with *Scene* space.

TODO: Move description of spaces to an overview page and create figures. TODO: Use numpy arrays for camera vectors?

```
fresnel.camera.fit(scene, view='auto', margin=0.05)
```

Fit a camera to a *Scene*

Create a camera that fits the entire hight of the scene in the image plane.

Parameters

- **scene** (*Scene*) – The scene to fit the camera to.
- **view** (*str*) – Select view
- **margin** (*float*) – Fraction of extra space to leave on the top and bottom of the scene.

view may be 'auto', 'isometric', or 'front'.

The isometric view is an orthographic projection from a particular angle so that the x,y, and z directions are equal lengths. The front view is an orthographic projection where +x points to the right, +y points up and +z points out of the screen in the image plane. 'auto' automatically selects 'isometric' for 3D scenes and 'front' for 2D scenes.

```
fresnel.camera.orthographic(position, look_at, up, height)
```

Orthographic camera

Parameters

- **position** (`numpy.ndarray` or `array_like`) – (3 : float32) - the position of the camera.
- **look_at** (`numpy.ndarray` or `array_like`) – (3 : float32) - the point the camera looks at (the center of the focal plane).
- **up** (`numpy.ndarray` or `array_like`) – (3 : float32) - a vector pointing up.
- **height** (*float*) – the height of the image plane.

An orthographic camera traces parallel rays from the image plane into the scene. Lines that are parallel in the *Scene* will remain parallel in the rendered image.

position is the center of the image plane in *Scene* space. *look_at* is the point in *Scene* space that will be in the center of the image. Together, these vectors define the image plane which is perpendicular to the line from *position* to *look_at*. Objects in front of the plane will appear in the rendered image, objects behind the plane will not.

up is a vector in *Scene* space that defines which direction points up (+y direction in the image). *up* does not need to be perpendicular to the line from *position* to *look_at*, but it must not be parallel to that line. *height* sets the height of the image in *Scene* units. The image width is determined by the aspect ratio of the image. The area *width* by *height* about the *look_at* point will be included in the rendered image.

TODO: show a figure

22.2 fresnel.color

Overview

<code>fresnel.color.linear</code>	Convert a sRGB color (or array of such colors) from the gamma corrected color space into the linear space.
-----------------------------------	---

Details

Color utilities.

`fresnel.color.linear` (*color*)

Convert a **sRGB** color (or array of such colors) from the gamma corrected color space into the linear space.

Standard tools for working with sRGB colors provide gamma corrected values. `fresnel` needs to perform calculations in a linear color space. This method converts from sRGB to the linear space. Use `linear()` when specifying material or particle colors with sRGB inputs (such as you find in a color picker).

`linear()` accepts **RGBA** input (such as from matplotlib's `colors.to_rgba` colormap method), but ignores the alpha channel and outputs an Nx3 array.

Parameters `color` (`numpy.ndarray` or `array_like`) – (3, Nx3, or Nx4 : float32) - RGB or RGBA color in the range [0,1].

Returns `numpy.ndarray` with the linearized color(s), same shape as `color`.

22.3 fresnel.geometry

Overview

<code>fresnel.geometry.Geometry</code>	Base class for all geometry.
<code>fresnel.geometry.ConvexPolyhedron</code>	Convex polyhedron geometry.
<code>fresnel.geometry.Cylinder</code>	Cylinder geometry.
<code>fresnel.geometry.Polygon</code>	Polygon geometry.
<code>fresnel.geometry.Sphere</code>	Sphere geometry.

Details

Geometric primitives.

`Geometry` provides operations common to all geometry classes. Use a specific geometry class to add objects to the `fresnel.Scene`.

See also:

Primitive properties Tutorial: Modifying primitive properties.

Material properties Tutorial: Modifying material properties.

Outline materials Tutorial: Applying outline materials.

Multiple geometries Tutorial: Displaying multiple geometries in a scene.

```
class fresnel.geometry.ConvexPolyhedron(scene, polyhedron_info, position=None, orientation=None, color=None, N=None, material=<fresnel.material.Material object>, outline_material=<fresnel.material.Material object>, outline_width=0.0)
```

Convex polyhedron geometry.

Define a set of convex polyhedron primitives. A convex polyhedron is defined by P outward facing planes (origin and normal vector) and a radius that encompass the shape. `fresnel.util.convex_polyhedron_from_vertices()` can construct this by computing the convex hull of a set of vertices.

Parameters

- **scene** (`fresnel.Scene`) – Add the geometry to this scene
- **polyhedron_info** (`dict`) – A dictionary containing the face normals (`face_normal`), origins (`face_origin`), colors (`face_color`), and the radius (`radius`)).
- **position** (`numpy.ndarray` or `array_like`) – ($N \times 3$: float32) - Position of each polyhedra.
- **orientation** (`numpy.ndarray` or `array_like`) – ($N \times 4$: float32) - Orientation of each polyhedra (as a quaternion).
- **color** (`numpy.ndarray` or `array_like`) – ($N \times 3$: float32) - Color of each polyhedron.
- **N** (`int`) – Number of spheres in the geometry. If `None`, determine `N` from `position`.

See also:

Convex polyhedron Tutorial: Defining and setting convex polyhedron geometry properties.

Note: The constructor arguments `position`, `orientation`, and `color` are optional. If you do not provide them, they are initialized to 0's.

Hint: Avoid costly memory allocations and type conversions by specifying primitive properties in the appropriate numpy array type.

position

Read or modify the positions of the polyhedra.

Type `fresnel.util.array`

orientation

Read or modify the orientations of the polyhedra.

Type `fresnel.util.array`

color

Read or modify the color of the polyhedra.

Type `fresnel.util.array`

color_by_face

Set to 0 to color particles by the per-particle color. Set to 1 to color faces by the per-face color. Set to a value between 0 and 1 to blend per-particle and per-face colors.

get_extents()

Get the extents of the geometry

Returns [[minimum x, minimum y, minimum z],[maximum x, maximum y, maximum z]]

class fresnel.geometry.**Geometry**

Base class for all geometry.

Geometry provides operations common to all geometry classes.

material

The geometry's material.

Type *fresnel.material.Material*

outline_material

The geometry's outline material.

Type *fresnel.material.Material*

outline_width

The geometry's outline width, in distance units in the scene's coordinate system.

Type *float*

Note: You cannot instantiate a Geometry directly. Use one of the sub classes.

disable()

Disable the geometry.

When disabled, the geometry will not be present in the scene.

enable()

Enable the geometry.

When enabled, the geometry will be present when rendering the scene.

remove()

Remove the geometry from the scene.

After calling remove, the geometry is no longer part of the scene. It cannot be added back into the scene. Use *disable()* if you want a reversible operation.

class fresnel.geometry.**Mesh**(scene, vertices, position=None, orientation=None, color=None, N=None, material=<fresnel.material.Material object>, outline_material=<fresnel.material.Material object>, outline_width=0.0)

Mesh geometry.

Define a set of triangle mesh primitives.

Parameters

- **scene** (*fresnel.Scene*) – Add the geometry to this scene
- **vertices** (*numpy.ndarray* or *array_like*) – (3Tx3 : float32) - Vertices of the triangles, listed contiguously. Vertices 0,1,2 define the first triangle, 3,4,5 define the second, and so on.
- **color** (*numpy.ndarray* or *array_like*) – (3Tx3 : float32) - Color of each vertex.
- **position** (*numpy.ndarray* or *array_like*) – (Nx3 : float32) - Positions of each mesh instance.

- **orientation** (`numpy.ndarray` or `array_like`) – (Nx4 : float32) - Orientation of each mesh instance (as a quaternion).
- **N** (`int`) – Number of mesh instances in the geometry. If `None`, determine N from `position`.

See also:

Mesh Tutorial: Defining and setting mesh geometry properties.

Note: The constructor arguments `position`, `orientation`, and `color` are optional, and just short-hand for assigning the attribute after construction.

Colors are in the linearized sRGB color space. Use `fresnel.color.linear()` to convert standard sRGB colors into this space. *Mesh* determines the color of a triangle using interpolation with the barycentric coordinates in every triangular face.

Hint: Avoid costly memory allocations and type conversions by specifying primitive properties in the appropriate numpy array type.

position

Read or modify the positions of the mesh instances.

Type `fresnel.util.array`

orientation

Read or modify the orientations of the mesh instances.

Type `fresnel.util.array`

color

Read or modify the color of the vertices.

Type `fresnel.util.array`

get_extents()

Get the extents of the geometry

Returns

[[**minimum x**, **minimum y**, **minimum z**], [**maximum x**, **maximum y**, **maximum z**]]

```
class fresnel.geometry.Polygon(scene, vertices, position=None, angle=None,
                               color=None, rounding_radius=0, N=None, material=<fresnel.material.Material object>,
                               outline_material=<fresnel.material.Material object>, outline_width=0.0)
```

Polygon geometry.

Define a set of simple polygon primitives. Each polygon face is always in the xy plane. Each polygon may have a different color and rotation angle.

Parameters

- **scene** (`fresnel.Scene`) – Add the geometry to this scene
- **vertices** (`numpy.ndarray` or `array_like`) – (Nx2 : float32) - Polygon vertices.
- **position** (`numpy.ndarray` or `array_like`) – (Nx2 : float32) - Position of each polygon.

- **angle** (`numpy.ndarray` or `array_like`) – (N : float32) - Orientation angle of each polygon.
- **color** (`numpy.ndarray` or `array_like`) – (Nx3 : float32) - Color of each polygon.
- **rounding_radius** (*float*) – Rounding radius for spheropolygons.
- **N** (*int*) – Number of polygons in the geometry. If `None`, determine N from `position`.

See also:

Polygon Tutorial: defining and setting polygon geometry properties

Note: The constructor arguments `position`, `angle`, and `color` are optional. If you do not provide them, they are initialized to 0's.

Hint: Avoid costly memory allocations and type conversions by specifying primitive properties in the appropriate numpy array type.

position

Read or modify the positions of the polygons.

Type `fresnel.util.array`

angle

Read or modify the orientation angles of the polygons.

Type `fresnel.util.array`

color

Read or modify the colors of the polygons.

Type `fresnel.util.array`

get_extents()

Get the extents of the geometry

Returns [[minimum x, minimum y, minimum z],[maximum x, maximum y, maximum z]]

```
class fresnel.geometry.Sphere(scene,      position=None,      radius=None,      color=None,
                             N=None,      material=<fresnel.material.Material object>,
                             outline_material=<fresnel.material.Material object>,  out-
                             line_width=0.0)
```

Sphere geometry.

Define a set of sphere primitives with positions, radii, and individual colors.

Parameters

- **scene** (`fresnel.Scene`) – Add the geometry to this scene
- **position** (`numpy.ndarray` or `array_like`) – (Nx3 : float32) - Positions of each sphere.
- **radius** (`numpy.ndarray` or `array_like`) – (N : float32) - Radius of each sphere.
- **color** (`numpy.ndarray` or `array_like`) – (Nx3 : float32) - Color of each sphere.
- **N** (*int*) – Number of spheres in the geometry. If `None`, determine N from `position`.

See also:

Sphere Tutorial: Defining and setting sphere geometry properties.

Note: The constructor arguments `position`, `radius`, and `color` are optional. If you do not provide them, they are initialized to 0's.

Hint: Avoid costly memory allocations and type conversions by specifying primitive properties in the appropriate numpy array type.

Tip: When all spheres are the same size, pass a single value for *radius* and numpy will broadcast it to all elements of the array.

position

Read or modify the positions of the spheres.

Type `fresnel.util.array`

radius

Read or modify the radii of the spheres.

Type `fresnel.util.array`

color

Read or modify the color of the spheres.

Type `fresnel.util.array`

get_extents ()

Get the extents of the geometry

Returns `[[minimum x, minimum y, minimum z],[maximum x, maximum y, maximum z]]`

22.4 fresnel.interact

Overview

`fresnel.interact.SceneView`

Details

Interactive Qt widgets.

class `fresnel.interact.SceneView` (*scene*, *max_samples*=2000)

View a fresnel Scene in real time

SceneView is a PySide2 widget that displays a *fresnel.Scene*, rendering it with *fresnel.tracer.Path* interactively. Use the mouse to rotate the camera view.

Parameters

- **scene** (*Scene*) – The scene to display.
- **max_samples** (*int*) – Sample until `max_samples` have been averaged.

- Left click to pitch and yaw
- Right click to roll
- Middle click to pan
- Hold ctrl to make small adjustments

Using in a standalone script

To use SceneView in a standalone script, import the `fresnel.interact` module, create your `fresnel.Scene`, instantiate the `SceneView`, show it, and start the app event loop.

```
import fresnel, fresnel.interact
# build Scene
view = fresnel.interact.SceneView(scene)
view.show()
fresnel.interact.app.exec_();
```

Using with jupyter notebooks

To use SceneView in a jupyter notebook, import `PySide2.QtCore` and activate jupyter's qt5 integration.

```
from PySide2 import QtCore
% gui qt
```

Import the `fresnel.interact` module, create your `fresnel.Scene`, and instantiate the `SceneView`. Do not call the app event loop, jupyter is already running the event loop in the background. When the `SceneView` object is the result of a cell, it will automatically show and activate focus.

```
import fresnel, fresnel.interact
# build Scene
fresnel.interact.SceneView(scene)
```

Note: The interactive window will open on the system that *hosts* jupyter.

See also:

[Interactive scene view](#) Tutorial: Interactive scene display

setScene (*scene*)

Set a new scene

Parameters *scene* (*Scene*) – The scene to render.

Also call `setScene` when you make any changes to the scene so that `SceneView` window will re-render the scene with the changes.

22.5 fresnel.light

Overview

<code>fresnel.light.Light</code>	Define a single light
<code>fresnel.light.butterfly</code>	Create a butterfly lighting setup.
<code>fresnel.light.cloudy</code>	Create a cloudy day lighting setup.
<code>fresnel.light.lightbox</code>	Create a light box lighting setup.
<code>fresnel.light.loop</code>	Create a loop lighting setup.
<code>fresnel.light.rembrandt</code>	Create a Rembrandt lighting setup.
<code>fresnel.light.ring</code>	Create a ring lighting setup.

Details

Lights provide light to a `fresnel.Scene`.

Without lights, nothing will be visible in the scene. Fresnel provides a number of quality lighting setups for your use, and you can always define custom lights.

See also:

[*Scene properties*](#) Tutorial: Setting scene properties.

[*Lighting setups*](#) Tutorial: Using lighting setups with scenes.

class `fresnel.light.Light` (*direction, color=(1, 1, 1), theta=0.375*)

Define a single light

Parameters

- **direction** (`numpy.ndarray` or `array_like`) – (3, float32) - Vector direction the light points (*in camera space*).
- **color** (`numpy.ndarray` or `array_like`) – (3, float32) - Linear RGB color and intensity of the light.
- **theta** (*float*) – Half angle of the cone that defines the area of the light (*radians*).

The direction vector may have any non-zero length, but only the direction the vector points matters.

The color also sets the light intensity. A (0.5, 0.5, 0.5) light is twice as bright as (0.25, 0.25, 0.25).

`fresnel.light.butterfly()`

Create a butterfly lighting setup.

The butterfly portrait lighting setup is front lighting with the key light (index 0) placed high above the camera and the fill light (index 1) below the camera.

Returns A list of lights.

`fresnel.light.cloudy()`

Create a cloudy day lighting setup.

The cloudy lighting setup mimics a cloudy day. A strong light comes from all directions above. A weaker light comes from all directions below (accounting for light “reflected” off the ground). Use path tracing for best results with this setup.

Returns A list of lights.

`fresnel.light.lightbox()`

Create a light box lighting setup.

The light box lighting setup places a single massive area light that covers the top, bottom, left, and right. Use path tracing for best results with this setup.

Returns A list of lights.

`fresnel.light.loop(side='right')`
Create a loop lighting setup.

The loop portrait lighting setup places the key light slightly to one side of the camera and slightly up (index 0). The fill light is on the other side of the camera at the level of the camera (index 1).

Parameters `side` (*str*) – ‘right’ or ‘left’ to choose which side of the camera to place the key light.

Returns A list of lights.

`fresnel.light.rembRANDt(side='right')`
Create a Rembrandt lighting setup.

The Rembrandt portrait lighting setup places the key light 45 degrees to one side of the camera and slightly up (index 0). The fill light is on the other side of the camera at the level of the camera (index 1).

Parameters `side` (*str*) – ‘right’ or ‘left’ to choose which side of the camera to place the key light.

Returns A list of lights.

`fresnel.light.ring()`
Create a ring lighting setup.

The ring lighting setup provides a strong front area light. This type of lighting is common in fashion photography. Use path tracing for best results with this setup.

Returns A list of lights.

22.6 fresnel.material

Overview

fresnel.material.Material

Define material properties.

Details

Materials describe the way light interacts with surfaces.

class `fresnel.material.Material` (*solid=0, color=(0, 0, 0), primitive_color_mix=0, roughness=0.3, specular=0.5, spec_trans=0, metal=0*)

Define material properties.

Materials control how light interacts with the geometry.

Parameters

- **solid** (*float*) – Set to 1 to pass through a solid color, regardless of the light and view angle.
- **color** (`numpy.ndarray` or `array_like`) – (3, float32) - Linear RGB color of the material.
- **primitive_color_mix** (*float*) – Set to 1 to use the color provided in the Geometry, 0 to use the color specified in the material, or a value in the range [0,1] to mix the two colors.
- **roughness** (*float*) – Roughness of the material. Nominally in the range [0,1].
- **specular** (*float*) – Control the strength of the specular highlights. Nominally in the range [0,1].

- **spec_trans** (*float*) – Control the amount of specular light transmission. In the range [0,1].
- **metal** (*float*) – Set to 0 for dielectric material, or 1 for metal. Intermediate values interpolate between the two.

See also:

Material properties Tutorial: Modifying material properties.

Note: Colors are in the linearized color space. Use `fresnel.color.linear()` to convert standard sRGB colors into this space.

22.7 fresnel.tracer

Overview

<code>fresnel.tracer.Path</code>	Path tracer.
<code>fresnel.tracer.Preview</code>	Preview ray tracer.
<code>fresnel.tracer.Tracer</code>	Base class for all ray tracers.

Details

Ray tracers process a `fresnel.Scene` and render output images.

Fresnel provides a `Preview` tracer to generate a quick approximate render and `Path` which provides soft shadows, reflections, and other effects.

See also:

Introduction Tutorial: Introduction to tracers

Tracer methods Tutorial: Configuring tracer parameters.

class `fresnel.tracer.Path` (*device*, *w*, *h*)
Path tracer.

Parameters

- **device** (*Device*) – Device to use for rendering.
- **w** (*int*) – Output image width.
- **h** (*int*) – Output image height.

The path tracer applies advanced lighting effects, including soft shadows, reflections, etc.... It operates by Monte Carlo sampling. Each call to `render()` performs one sample per pixel. The output image is the mean of all the samples. Many samples are required to produce a smooth image.

`sample()` provides a convenience API to make many samples with a single call.

reset ()

Clear the output buffer and start sampling a new image. Increment the random number seed so that the new image is statistically independent from the previous.

sample (*scene*, *samples*, *reset=True*, *light_samples=1*)

Parameters

- **scene** (*Scene*) – The scene to render.
- **samples** (*int*) – The number of samples to take per pixel.
- **reset** (*bool*) – When True, call `reset()` before sampling

Returns A reference to the current output buffer as a `fresnel.util.image_array`.

Note: When `reset` is False, subsequent calls to `sample()` will continue to add samples to the current output image. Use the same number of light samples when sampling an image in this way.

class `fresnel.tracer.Preview` (*device*, *w*, *h*, *aa_level*=0)

Preview ray tracer.

Parameters

- **device** (*Device*) – Device to use for rendering.
- **w** (*int*) – Output image width.
- **h** (*int*) – Output image height.
- **aa_level** (*int*) – Amount of anti-aliasing to perform

aa_level

Amount of anti-aliasing to perform

Type `int`

Overview

The *Preview* tracer produces a preview of the scene quickly. It approximates the effect of light on materials. The output of the *Preview* tracer will look very similar to that from the *Path* tracer, but will miss soft shadows, reflection, transmittance, and other lighting effects.

TODO: show examples

Anti-aliasing

Set *aa_level* to control the amount of anti-aliasing performed. The default value of 0 performs no anti-aliasing to enable the fastest possible preview renders. A value of 1 samples 2x2 subpixels, a value of 2 samples 4x4 subpixels, a value of 3 samples 8x8 subpixels, etc ... Samples are jittered with random numbers. Different *seed* values will result in different output images.

TODO: show examples

Tip: Use *aa_level* = 3 when using the *Preview* tracer to render production quality output.

class `fresnel.tracer.Tracer`

Base class for all ray tracers.

Tracer provides operations common to all ray tracer classes.

Each *Tracer* instance stores a pixel output buffer. When you `render()` a *Scene*, the current data stored in the buffer is overwritten with the new image.

Note: You cannot instantiate a Tracer directly. Use one of the sub classes.

output

Reference to the current output buffer (modified by `render()`)

Type `fresnel.util.image_array`

linear_output

Reference to the current output buffer in linear color space (modified by `render()`)

Type `fresnel.util.array`

seed

Random number seed.

Type `int`

disable_highlight_warning()

Disable the highlight clipping warnings.

enable_highlight_warning (*color*=(1, 0, 1))

Enable highlight clipping warnings.

When a pixel in the rendered image is too bright to represent, make that pixel the given *color* to flag the problem to the user.

Parameters *color* (*tuple*) – Color to make the highlight warnings.

histogram()

Compute a histogram of the image.

The histogram is computed as a lightness in the sRGB color space. The histogram is computed only over the visible pixels in the image, fully transparent pixels are ignored. The returned histogram is nbins x 4, the first column contains the lightness histogram and the next 3 contain R,B, and G channel histograms respectively.

Returns (histogram, bin_positions).

render (*scene*)

Render a scene.

Parameters *scene* (*Scene*) – The scene to render.

Returns A reference to the current output buffer as a `fresnel.util.image_array`.

Render the given scene and write the resulting pixels into the output buffer.

resize (*w*, *h*)

Resize the output buffer.

Parameters

- *w* (*int*) – New output buffer width.
- *h* (*int*) – New output buffer height.

Warning: `resize()` clears any existing image in the output buffer.

22.8 fresnel.util

Overview

<code>fresnel.util.array</code>	Map internal fresnel buffers as <code>numpy.ndarray</code> objects.
<code>fresnel.util.convex_polyhedron_from_vertices</code>	Convert convex polyhedron vertices to data structures that fresnel can draw.
<code>fresnel.util.image_array</code>	Map internal image buffers as <code>numpy.ndarray</code> objects.

Details

Utilities.

class `fresnel.util.array` (*buf, geom*)

Map internal fresnel buffers as `numpy.ndarray` objects.

`fresnel.util.array` provides a python interface to access internal data of memory buffers stored and managed by fresnel. You can access a `fresnel.util.array` as if it were a `numpy.ndarray` (with limited operations). Below, *slice* is a *slice* or array *indexing* mechanic that **numpy** understands.

Writing

Write to an array with `array[slice] = v` where *v* is `numpy.ndarray`, `list`, or scalar value to broadcast. When *v* is a *contiguous* `numpy.ndarray` of the same data type, the data is copied directly from *v* into the internal buffer. Otherwise, it is converted to a `numpy.ndarray` before copying.

Reading

Read from an array with `v = array[slice]`. This returns a **copy** of the data as a `numpy.ndarray` each time it is called.

shape

Dimensions of the array.

Type `tuple`

dtype

Numpy data type

fresnel.util.convex_polyhedron_from_vertices (*vertices*)

Convert convex polyhedron vertices to data structures that fresnel can draw.

Parameters *vertices* (`numpy.ndarray` or `array_like`) – (N×3 : float64) - The vertices of the polyhedron.

Returns A dict containing the information used to draw the polyhedron. The dict contains the keys `face_origin`, `face_normal`, `face_color`, and `radius`.

The dictionary can be used directly to draw a polyhedron from its vertices:

```
scene = fresnel.Scene()
polyhedron = fresnel.util.convex_polyhedron_from_vertices(vertices)
geometry = fresnel.geometry.ConvexPolyhedron(scene,
```

(continues on next page)

(continued from previous page)

```
polyhedron,  
position=[0, 0, 0],  
orientation=[1, 0, 0, 0])
```

class `fresnel.util.image_array` (*buf, geom*)

Map internal image buffers as `numpy.ndarray` objects.

Inherits from `array` and provides all of its functionality, plus some additional convenience methods specific to working with images. Images are represented as `WxHx4 numpy.ndarray` of `uint8` values in **RGBA** format.

When a `image_array` is the result of an image in a Jupyter notebook cell, Jupyter will display the image.

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the

(continues on next page)

(continued from previous page)

Licensors for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.
4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and

(continues on next page)

(continued from previous page)

wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.
6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify,

(continues on next page)

(continued from previous page)

defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

24.2.6 Intel TBB

Intel's threaded building blocks library provides support for parallel execution on CPUS and is used under the following license:

Apache License
Version 2.0, January 2004
<http://www.apache.org/licenses/>

TERMS AND CONDITIONS FOR USE, REPRODUCTION, AND DISTRIBUTION

1. Definitions.

"License" shall mean the terms and conditions for use, reproduction, and distribution as defined by Sections 1 through 9 of this document.

"Licensor" shall mean the copyright owner or entity authorized by the copyright owner that is granting the License.

"Legal Entity" shall mean the union of the acting entity and all other entities that control, are controlled by, or are under common control with that entity. For the purposes of this definition, "control" means (i) the power, direct or indirect, to cause the direction or management of such entity, whether by contract or otherwise, or (ii) ownership of fifty percent (50%) or more of the outstanding shares, or (iii) beneficial ownership of such entity.

(continues on next page)

(continued from previous page)

"You" (or "Your") shall mean an individual or Legal Entity exercising permissions granted by this License.

"Source" form shall mean the preferred form for making modifications, including but not limited to software source code, documentation source, and configuration files.

"Object" form shall mean any form resulting from mechanical transformation or translation of a Source form, including but not limited to compiled object code, generated documentation, and conversions to other media types.

"Work" shall mean the work of authorship, whether in Source or Object form, made available under the License, as indicated by a copyright notice that is included in or attached to the work (an example is provided in the Appendix below).

"Derivative Works" shall mean any work, whether in Source or Object form, that is based on (or derived from) the Work and for which the editorial revisions, annotations, elaborations, or other modifications represent, as a whole, an original work of authorship. For the purposes of this License, Derivative Works shall not include works that remain separable from, or merely link (or bind by name) to the interfaces of, the Work and Derivative Works thereof.

"Contribution" shall mean any work of authorship, including the original version of the Work and any modifications or additions to that Work or Derivative Works thereof, that is intentionally submitted to Licensor for inclusion in the Work by the copyright owner or by an individual or Legal Entity authorized to submit on behalf of the copyright owner. For the purposes of this definition, "submitted" means any form of electronic, verbal, or written communication sent to the Licensor or its representatives, including but not limited to communication on electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, the Licensor for the purpose of discussing and improving the Work, but excluding communication that is conspicuously marked or otherwise designated in writing by the copyright owner as "Not a Contribution."

"Contributor" shall mean Licensor and any individual or Legal Entity on behalf of whom a Contribution has been received by Licensor and subsequently incorporated within the Work.

2. Grant of Copyright License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable copyright license to reproduce, prepare Derivative Works of, publicly display, publicly perform, sublicense, and distribute the Work and such Derivative Works in Source or Object form.
3. Grant of Patent License. Subject to the terms and conditions of this License, each Contributor hereby grants to You a perpetual, worldwide, non-exclusive, no-charge, royalty-free, irrevocable (except as stated in this section) patent license to make, have made, use, offer to sell, sell, import, and otherwise transfer the Work, where such license applies only to those patent claims licensable by such Contributor that are necessarily infringed by their

(continues on next page)

(continued from previous page)

Contribution(s) alone or by combination of their Contribution(s) with the Work to which such Contribution(s) was submitted. If You institute patent litigation against any entity (including a cross-claim or counterclaim in a lawsuit) alleging that the Work or a Contribution incorporated within the Work constitutes direct or contributory patent infringement, then any patent licenses granted to You under this License for that Work shall terminate as of the date such litigation is filed.

4. Redistribution. You may reproduce and distribute copies of the Work or Derivative Works thereof in any medium, with or without modifications, and in Source or Object form, provided that You meet the following conditions:
 - (a) You must give any other recipients of the Work or Derivative Works a copy of this License; and
 - (b) You must cause any modified files to carry prominent notices stating that You changed the files; and
 - (c) You must retain, in the Source form of any Derivative Works that You distribute, all copyright, patent, trademark, and attribution notices from the Source form of the Work, excluding those notices that do not pertain to any part of the Derivative Works; and
 - (d) If the Work includes a "NOTICE" text file as part of its distribution, then any Derivative Works that You distribute must include a readable copy of the attribution notices contained within such NOTICE file, excluding those notices that do not pertain to any part of the Derivative Works, in at least one of the following places: within a NOTICE text file distributed as part of the Derivative Works; within the Source form or documentation, if provided along with the Derivative Works; or, within a display generated by the Derivative Works, if and wherever such third-party notices normally appear. The contents of the NOTICE file are for informational purposes only and do not modify the License. You may add Your own attribution notices within Derivative Works that You distribute, alongside or as an addendum to the NOTICE text from the Work, provided that such additional attribution notices cannot be construed as modifying the License.

You may add Your own copyright statement to Your modifications and may provide additional or different license terms and conditions for use, reproduction, or distribution of Your modifications, or for any such Derivative Works as a whole, provided Your use, reproduction, and distribution of the Work otherwise complies with the conditions stated in this License.

5. Submission of Contributions. Unless You explicitly state otherwise, any Contribution intentionally submitted for inclusion in the Work by You to the Licensor shall be under the terms and conditions of this License, without any additional terms or conditions. Notwithstanding the above, nothing herein shall supersede or modify the terms of any separate license agreement you may have executed with Licensor regarding such Contributions.

6. Trademarks. This License does not grant permission to use the trade names, trademarks, service marks, or product names of the Licensor, except as required for reasonable and customary use in describing the origin of the Work and reproducing the content of the NOTICE file.
7. Disclaimer of Warranty. Unless required by applicable law or agreed to in writing, Licensor provides the Work (and each Contributor provides its Contributions) on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied, including, without limitation, any warranties or conditions of TITLE, NON-INFRINGEMENT, MERCHANTABILITY, or FITNESS FOR A PARTICULAR PURPOSE. You are solely responsible for determining the appropriateness of using or redistributing the Work and assume any risks associated with Your exercise of permissions under this License.
8. Limitation of Liability. In no event and under no legal theory, whether in tort (including negligence), contract, or otherwise, unless required by applicable law (such as deliberate and grossly negligent acts) or agreed to in writing, shall any Contributor be liable to You for damages, including any direct, indirect, special, incidental, or consequential damages of any character arising as a result of this License or out of the use or inability to use the Work (including but not limited to damages for loss of goodwill, work stoppage, computer failure or malfunction, or any and all other commercial damages or losses), even if such Contributor has been advised of the possibility of such damages.
9. Accepting Warranty or Additional Liability. While redistributing the Work or Derivative Works thereof, You may choose to offer, and charge a fee for, acceptance of support, warranty, indemnity, or other liability obligations and/or rights consistent with this License. However, in accepting such obligations, You may act only on Your own behalf and on Your sole responsibility, not on behalf of any other Contributor, and only if You agree to indemnify, defend, and hold each Contributor harmless for any liability incurred by, or claims asserted against, such Contributor by reason of your accepting any such warranty or additional liability.

END OF TERMS AND CONDITIONS

APPENDIX: How to apply the Apache License to your work.

To apply the Apache License to your work, attach the following boilerplate notice, with the fields enclosed by brackets "[]" replaced with your own identifying information. (Don't include the brackets!) The text should be enclosed in the appropriate comment syntax for the file format. We also recommend that a file or class name and description of purpose be included on the same "printed page" as the copyright notice for easier identification within third-party archives.

Symbols

`__version__` (in module *fresnel*), 123

A

`aa_level` (*fresnel.tracer.Preview* attribute), 139
`angle` (*fresnel.geometry.Polygon* attribute), 133
`array` (class in *fresnel.util*), 141
`available_gpus` (*fresnel.Device* attribute), 124
`available_modes` (*fresnel.Device* attribute), 124

B

`background_alpha` (*fresnel.Scene* attribute), 125
`background_color` (*fresnel.Scene* attribute), 125
`basis` (*fresnel.camera.Camera* attribute), 127
`butterfly()` (in module *fresnel.light*), 136

C

`Camera` (class in *fresnel.camera*), 126
`camera` (*fresnel.Scene* attribute), 125
`cloudy()` (in module *fresnel.light*), 136
`color` (*fresnel.geometry.ConvexPolyhedron* attribute), 129
`color` (*fresnel.geometry.Cylinder* attribute), 130
`color` (*fresnel.geometry.Mesh* attribute), 132
`color` (*fresnel.geometry.Polygon* attribute), 133
`color` (*fresnel.geometry.Sphere* attribute), 134
`color_by_face` (*fresnel.geometry.ConvexPolyhedron* attribute), 129
`convex_polyhedron_from_vertices()` (in module *fresnel.util*), 141
`ConvexPolyhedron` (class in *fresnel.geometry*), 128
`Cylinder` (class in *fresnel.geometry*), 130

D

`Device` (class in *fresnel*), 123
`device` (*fresnel.Scene* attribute), 125
`disable()` (*fresnel.geometry.Geometry* method), 131
`disable_highlight_warning()` (*fresnel.tracer.Tracer* method), 140

`dtype` (*fresnel.util.array* attribute), 141

E

`enable()` (*fresnel.geometry.Geometry* method), 131
`enable_highlight_warning()` (*fresnel.tracer.Tracer* method), 140

F

`fit()` (in module *fresnel.camera*), 127
`fresnel` (module), 123
`fresnel.camera` (module), 126
`fresnel.color` (module), 128
`fresnel.geometry` (module), 128
`fresnel.interact` (module), 134
`fresnel.light` (module), 136
`fresnel.material` (module), 137
`fresnel.tracer` (module), 138
`fresnel.util` (module), 141

G

`Geometry` (class in *fresnel.geometry*), 131
`get_extents()` (*fresnel.geometry.ConvexPolyhedron* method), 130
`get_extents()` (*fresnel.geometry.Cylinder* method), 130
`get_extents()` (*fresnel.geometry.Mesh* method), 132
`get_extents()` (*fresnel.geometry.Polygon* method), 133
`get_extents()` (*fresnel.geometry.Sphere* method), 134
`get_extents()` (*fresnel.Scene* method), 125

H

`height` (*fresnel.camera.Camera* attribute), 126
`histogram()` (*fresnel.tracer.Tracer* method), 140

I

`image_array` (class in *fresnel.util*), 142

L

Light (*class in fresnel.light*), 136
lightbox() (*in module fresnel.light*), 136
lights (*fresnel.Scene attribute*), 125
linear() (*in module fresnel.color*), 128
linear_output (*fresnel.tracer.Tracer attribute*), 140
look_at (*fresnel.camera.Camera attribute*), 126
loop() (*in module fresnel.light*), 137

M

Material (*class in fresnel.material*), 137
material (*fresnel.geometry.Geometry attribute*), 131
Mesh (*class in fresnel.geometry*), 131
mode (*fresnel.Device attribute*), 124

O

orientation (*fresnel.geometry.ConvexPolyhedron attribute*), 129
orientation (*fresnel.geometry.Mesh attribute*), 132
orthographic() (*in module fresnel.camera*), 127
outline_material (*fresnel.geometry.Geometry attribute*), 131
outline_width (*fresnel.geometry.Geometry attribute*), 131
output (*fresnel.tracer.Tracer attribute*), 140

P

Path (*class in fresnel.tracer*), 138
pathtrace() (*in module fresnel*), 125
points (*fresnel.geometry.Cylinder attribute*), 130
Polygon (*class in fresnel.geometry*), 132
position (*fresnel.camera.Camera attribute*), 126
position (*fresnel.geometry.ConvexPolyhedron attribute*), 129
position (*fresnel.geometry.Mesh attribute*), 132
position (*fresnel.geometry.Polygon attribute*), 133
position (*fresnel.geometry.Sphere attribute*), 134
Preview (*class in fresnel.tracer*), 139
preview() (*in module fresnel*), 125

R

radius (*fresnel.geometry.Cylinder attribute*), 130
radius (*fresnel.geometry.Sphere attribute*), 134
rembrandt() (*in module fresnel.light*), 137
remove() (*fresnel.geometry.Geometry method*), 131
render() (*fresnel.tracer.Tracer method*), 140
reset() (*fresnel.tracer.Path method*), 138
resize() (*fresnel.tracer.Tracer method*), 140
ring() (*in module fresnel.light*), 137

S

sample() (*fresnel.tracer.Path method*), 138
Scene (*class in fresnel*), 124

SceneView (*class in fresnel.interact*), 134
seed (*fresnel.tracer.Tracer attribute*), 140
setScene() (*fresnel.interact.SceneView method*), 135
shape (*fresnel.util.array attribute*), 141
Sphere (*class in fresnel.geometry*), 133

T

Tracer (*class in fresnel.tracer*), 139

U

up (*fresnel.camera.Camera attribute*), 126
